PREFACE

This is the fourth annual Population Report which provide a quick reference on estimates of some demographic indicators and Vital Statistics performance in Botswana.

Selected Demographic Indicators covers fertility, mortality, population distribution by districts, special age groups and population density. Vital Statistics performance includes births, deaths and marriages data registered from January 1995 to December 1995 by the Department of Civil Registration.

This publication is a result of collaborative efforts between the Civil Registration Department of Labour and Home Affairs Ministry and the Demography Unit of the Central Statistics Office.

BACKGROUND

Demographic Indicators

This part of the report presents population statistics provided by the 1981 to 1991 census as well as the 1995 projections. Censuses are the main sources of data in Botswana. The statistics include a summary of fertility, mortality, population distribution by districts/Village or density and special age groups. The information is essential for assessment of the country's social and demographic status. It is also useful in the development of programmes aimed at improving the formulation and implementation of the various policies for planning purposes. More information on the census is also available in most CSO census publications like the Administrative/Technical Report and the Guide to villages of Botswana.

Civil Registration

The Botswana Civil Registration Act dates back to the beginning of the 19th Century, when it was for the Non-Africans only, but was amended in 1968 to cover all races. After the amendment, this Act made registration of all events compulsory in eleven areas but optional in other parts of the country. The compulsory registration areas comprise four urban districts (Gaborone, Francistown, Lobatse and Selibe-Phikwe) and seven large villages (Molepolole, Kanye, Serowe, Mochudi, Mahalapye, Maun and Kasane). These constituted 34 percent of the total population of Botswana in 1991.

The Department of Civil Registration is responsible for registering and keeping records of all births, deaths and marriages occurring in Botswana, and for issuing the corresponding certificates for all registered events. The Department serves as the sole source of registered vital statistics on a yearly basis.

Vital statistics is extracted from the vital events registration forms by the Demography unit of the Central Statistics Office (CSO). Initially the processing and tabulation of tables was done manually, but now it has been computerised. Analysis of this information by the CSO started in 1986 with the aim of establishing a modern data management system for the Department of Civil Registration.

It is the Botswana Government endeavour to improve the National Civil Registration system, which is hoped to complement the census information. Births, Marriages and Deaths statistics from the Department of Civil Registration are being analysed and compared with the medical statistics.

The major setback is the failure of most people to register vital events as they occur. This resulted in low registration of vital events as it appears throughout the tables. Therefore the statistics would not be reliable to estimate vital rates as much as for planning. The comparison with the medical statistics data shows the extent of the incompleteness of the registration.

As a result of low registrations of births and deaths experienced, the Department of Civil Registration tried to improve the registration in the 1980s by posting some of its own registration staff to the compulsory registration areas. They were expected to visit all health institutions daily to register all births and deaths occurring at the institutions. In the optional registration areas, the District Commissioner's Office continued to be responsible for the registration of births and deaths and the dispatch of registration forms to the central office.

In another attempt to improve the civil registration system, the Department of Civil Registration embarked on a pilot project where events are registered immediately after they occur, and the certificates issued at district of occurrence. This project which started in 1992, covered Francistown, Serowe, Kanye and Gumare. Births and Deaths are the only events covered by the project, because they have a problem of poor registration. The data from this project is provided to the CSO in computer diskettes for direct use on the computer.

SUMMARY ANALYSIS

SELECTED DEMOGRAPHIC INDICATORS

Population and Vital Statistics

The population part of this section shows that the Botswana citizen abroad was between 37,377 and 42,069 from 1981 to 1995. They were 42,069 in 1981 and 37,497 in 1991. Non-citizens in Botswana increased from 15,667 in 1981 to 32,522 in 1995. The number of households in Botswana doubled from 170,833 in 1981 to 324,749 in 1995 and their corresponding average household sizes reduced from 5.5 in 1981 to 4.5 in 1995 (Table 1.1).

The Vital Statistics part show that there was an improvement in all mortality indicators; Crude Death Rate (CDR), Infant Mortality Rate (IMR), and Childhood Mortality Rate (CMR), during the period 1981 to 1995. Crude Death Rate went down from 13.0 to 11.0 deaths per 1,000 population from the period 1981 to 1995. Furthermore, from the same Table (Table 1.1) IMR declined from 71.0 deaths per 1,000 births in 1981 to 43.1 in 1995. In addition to the above, LEB increased from 56.2 years in 1981 to 66.4 in 1995.

Table 1.1 further show that Total Fertility Rate (TFR) declined from 6.6 to 4.1 births per woman (point estimates) from 1981 to 1995 respectively while growth rate dropped between 1981 to 1995 from 3.4 to 2.3 percent. This may be attributed to the high rates of urbanisation and partly to the increase in labour force participation rates among women.

Density

The cities and towns of Botswana are the most densely populated areas in Botswana (Table 1.2), with an average of 610 people per square kilometre (Table 1.2). They are coincidentally in the eastern side of the country where most of the economic activities are taking place. The North West, Ghanzi and Kgalagadi districts which are on the western side of the country have an average population density of one person per square kilometre. Central district had a density of three people per square kilometre. This is because in addition to having the highest population it also has the largest area in square kilometres.

Age Groups

It is evident from Table 1.3 that Central district had the highest number of estimated population of all age groups in Bostwana, amounting to a total population of 441,776 people in 1995. This could be due to the fact that this district has the largest area, encompassing four sub-district. Gaborone and Southern came second and third with 165,343 and 157,670 respectively. The age group 15-64 was the majority in all districts.

Population by village/town

Gaborone as the capital city had the highest number of people in 1981, 1991 to 1995 with Francistown being second in all these years. In 1991 Molepolole had the highest number amongst all the villages and Kasane had the lowest number (see Table 1.4).

BIRTHS

Birth registration consists of completing either a `Notice of Live Birth' form if the registration is done immediately (within a year), or `Notice of Live Birth' together with 'Late Registration of Birth' form, if the registration is done after a year.

When the forms arrive at the Department of Civil Registration, the names and other particulars of both the mother and the child are entered into a general register and the forms are filed and stored according to the district and year of registration. Birth Certificates are subsequently issued. There is a nominal payment of 50 thebe (P0.50) for a Birth Certificate.

The following analysis covers the occurrences and registration of births in 1995.

Occurrences

(a) District of occurrence

The highest number of registered births occurring in 1995 occurred in Francistown (Table 2.1 and Chart 1), recording 24 percent of the total registered births. Almost all of these births were registered through the pilot project. Central followed with 20 percent, with the project still contributing the largest number.

(b) Month of occurrence

Birth occurrences (as shown in Table2. 2) were more or less evenly distributed throughout the year. Of the registered births, highest number occurred in January, about 2,473 births which is 11 percent.

(c) Age of mother and marital status.

Most births (Table 2.3) occurred to single mothers; about 83 percent of births were to single or unmarried mothers. This occurrence of more births to single mothers goes with the findings of the 1991 Census where over 50 percent of the births that occurred were to single mothers.

Most of the recorded births (95%) occurred to females in the age group 15 to 39 years (see Table 2.3). The proportion of births increased with age until age group 20-24 and thereafter decreased with an increase in the age of mother. The highest number of births registered occurred to mothers in the age group 20-24 years, with a record of 30 percent.

Registrations

(a) District of registration

The highest number of births were registered (Table 2.4) in Central district followed by Francistown, recording 20 and 19 percent respectively. The highest figure of 5,589 was registered in Francistown through the project. The last observation is that more males were born than females.

(b) Month of registration

Monthly registration (Table 2.5), do not show any significant monthly variation for all the months throughout the year. The lowest deaths were registered in February and the highest were registered in September. The two months registered 2,530 and 3688 respectively.

(c) Age and marital status of mother

Births by age and marital status (Table 2.6) shows that on average 70 percent of the registered births were born to single mothers, while the other 30 were born to married ones. Generally project and non-project areas had high number of births occurrences, 83 and 63 percent respectively.

The majority of births (Tables 2.6) registered were to mothers aged 15-34 years. The highest number recorded was to the mothers aged 20-24 years. This shows a consistent relationship between births occurrence by age of mother and registration by age of mother.

Observation

As a common observation (for non-project figures) in 1995 there were more births registered in the same year than occurring. The most probable explanation is the legislation, which allows for compulsory and voluntary registration areas. This may also be due to lack of knowledge by the society at large on the importance of registration of births. As such most people do not register births immediately when they occur. People register later when they are forced to produce Births Certificates at places like schools in order to enrol their children and at the insurance companies for claims.

DEATHS

As in the case of births, deaths registration is done by completing the "Notice of death by a medical professional" called "Form B5" for deaths occurring in institutions and "Form B4" for those occurring outside institutions.

The following analysis however covers occurrences and registrations of deaths extracted from the death records in the Department of Civil Registration from January 1995 to December 1995.

Occurrences

(a) District of occurrence and residence

Majority of the deaths occurring in 1995 as shown in Table 2.7 occurred in Central district (24 percent) than in any other district. Francistown came second with 17 percent, followed by Gaborone with 15 percent. Almost all the deaths from Francistown were registered through the project, i.e. about 96% of deaths occurring and registered in Francistown were registered through the project. There were 1,193 deaths to people who were residing in Central District at the time of dying, which was the highest recorded in a district, and the lowest figure of 7 deaths was recorded in Orapa.

(b) Month of occurrence

The numbers of death occurrences during the year 1995 (Table 2.9) are more or less evenly distributed throughout the year. Majority of deaths, were to males than females in each month for the whole year. The monthly average number of deaths occurrence was 428 for the whole country throughout.

(c) Age at death

There were more reported deaths of people aged 65 years and over (Table 2.10) than any age group. Those aged 25-34 and 35-44 years together made 29 percent of total deaths, with more deaths to males than females.

(d) Exact place of occurrence and form type.

The deaths occurring in the institutions as shown on Table 2.11 accounted for 74 percent of all deaths. Form B5 (which is "Notification of death by a medical professional") was the most common form type making 95 percent as indicated in Table 2.12 (a). On Table 2.12 (b) most deaths occurred in institutions which could be due to the fact that people go to health institutions mostly when they are in poor health conditions, hence the greater chances of them dying there.

(f) Cause of death

Infectious and Parasitic diseases as shown on Tables 2.13A, were the major cause of deaths, accounting for 25 percent of all deaths, followed by diseases of the circulatory system which caused 19 percent of all deaths. Diseases of the skin and subcutaneous tissues as well as those of the muscular-skeletal system and connective tissues caused the least number of deaths, each accounting for one death out of 3,595 deaths.

Deaths registered through the project, on Table 2.13B, show that more deaths were caused by diseases of the respiratory system. These diseases caused 15 percent of project deaths. Infectious and Parasitic diseases accounted for 14 percent of deaths. Lastly most births were to those people aged 65 years and over followed by under ones. These recorded 939 and 825 respectively. The age group 25-34 followed with 803 deaths.

Registrations

(a) District of registration

Central district registered 30 percent of all registered deaths. This was the highest proportion. Serowe/Palapye sub-district registered 29 percent which is more than any sub-district or district. Francistown registered the second highest(17%) to Central, as shown on Table 2.14.

(b) Month of registration

Deaths were evenly registered throughout the year (Table 2.15), with a minimum of 367 deaths (registered in November) and a maximum of 530 deaths (registered in July).

(c) Age at death

Like in occurrence the highest number of registered deaths, were to adults aged 65+ registering 1,003 deaths out of 5,424 deaths, as shown on Table 2.16, followed by the age group 25-34 with 833 deaths (Table 2.16).

(d) Exact place of death and form-type

The number of deaths occurring in health facilities (Table 2.17) constituted 72% of the total number of registered deaths in Botswana. Table 2.18 (a) show that deaths reported by a medical practitioner (through a form called Doctor-B5) made 92% of all reported deaths. On the other hand deaths registered through the project (Table 2.18 (b)) were reported through form D2 (about 88%). This form is completed when registering those deaths occurring in health institutions.

(e) Cause of death

A substantial proportion of the registered deaths are caused by Infectious & Parasitic diseases, diseases of the Circulatory system and Respiratory system (Tables 2.19A and 2.19B together with Chart 2).

Observation

Like in the case of births, there were more deaths being registered than deaths occurring in 1995. For example out of 5,424 deaths registered 5,131 (95%) occurred in the same year (1995).

Comparison of the project and non-project data

The available data for the four project districts show that pilot project registration is doing well when compared to the non-project ones. Project proved to be doing well by registering in four areas a number almost equal to deaths occurring in all other 17 districts together.

MARRIAGES

Registered marriage in Botswana, takes place on the basis of the sanctioning by either the church or the court. In both cases, marriage may be arranged through Banns, that is, the usual practice of proclaiming the names of the candidates for a period of fourteen days before formalising marriage, or by a special licence which expedites the marriage process. Processed marriage registration forms are subsequently dispatched to the Department of Civil Registration for issuance of a marriage certificate.

The system was also intended to provide detailed statistics on marriages in the country, which may, in conjunction with other information, help to explain fertility behaviour in Botswana. The following analysis covers occurrences and registrations of marriages extracted from the records in the Department of Civil Registration for the period of January 1995 and December 1995.

(a) District of registration

Most marriages as shown in Table 2.20, are registered in urban areas and those districts with large urban villages. For instance Gaborone, Francistown, Selibe-Phikwe, Southern and Central registered 72 percent of all marriages.

(b) Month of registration

Most of the marriages for the year 1995 as shown on Table 2.20, were registered during the period August through to December. The highest number was registered in December. This may be attributed to the long holiday season. It is also a time when the weather is suitable for out-door activities like marriage ceremonies.

(c) District of registration and marriage type

It is evident from the data (Table 2.21) that Court Banns, are the most common type of marriage, making 73 percent of the total marriages. Most marriages were registered in Gaborone and Francistown, the two cities contributed to 36 percent of the total registered marriages.

(d) Age of husband/wife and previous marital status

Marriages to males (Table 2.22 and Chart 2.3) occur mostly to bachelors aged between 25 to 44 years. This age group made 80 percent of marriages in 1995. On the other hand (Table 2.23 and Chart 4) marriages to females occur mostly to spinsters, aged between 20-39 years making 89 percent of marriages in 1995.

Chart 3
Marriage by age of Husband

Chart 4
Marriages by age of wife

(e) Occupation of husband/wife and marriage type

The data from Table 2.24 suggest that male professionals have a greater tendency to marry than other types of workers, while Table 2.25 shows that more female service workers marry (45 percent) than any other occupation.

(f) Residence of husband/wife at the time of marriage

Husbands were mostly aged between 25 and 49 years at the times of marriage (Table 2.26), while wives were mostly aged between 20 and 44 years (Table 2.27), making 90 and 94 percent respectively. The highest percent of these husband and wives were living in Gaborone i.e. about 23 and 21 percent respectively were residing in Gaborone at the time of marriage.

COMPLETENESS OF BIRTHS AND DEATHS REGISTRATION.

Births

The Health Statistics data set, shown on Table 2.28A, shows that the number of births, occurring in institutions and non-institutions (Health statistics set) are high when compared to those from the vital registration. The registered births occurring in 1995 are 63 percent of the total births which were registered in health institutions (Medical Statistics). This clearly indicates that, registration of births is still lacking behind.

Deaths

Table 2.28B shows that unlike births the number of deaths from the Civil registration in 1995 was more than those from the Medical statistics; i.e. there were 3,028 deaths registered with the Civil registration, while those from the Medical statistics is 1,480. This may be due to the importance attached to the death certificate especially for the benefits to the next of kin. The main reason being that for the next of kin to make any claim in connection with the deceased, they need a death certificate, which they can only obtain by registering the concerned death with the Civil Registration department.

RECOMMENDATION

In view of low registration of events in Botswana there is a need to find ways of improving on registration. One way could be to identify all the villages and localities in Botswana and make them the focal point of registration of events. These focal points could be managed by headmen and/or extension workers, in this case registration could be done even at ward level, thereby improving registration of events. Identification of all localities and villages could be done through the Surveys Department in the Ministry of Local Government Lands and Housing. This exercise could be costly and as such Cartography Unit of the CSO could also be of assistance in this area especially when done as part of the census.

TABLE 1.1 POPULATION AND VITAL STATISTICS BY YEAR

INDICATOR	1981	1991	1992	1993	1994	1995
De-facto Population						
Male	443,104	634,400	650,088	666,945	684,751	701,603
Female	479,923	692,396	708,551	724,300	739,885	757,225
Total	941,027	1,326,796	1,358,639	1,391,245	1,424,636	1,458,828
Total Land Area (Square km)	581,730	581,730	581,730	581,730	581,730	581,730
Density	1.6	2.3	2.3	2.4	2.4	2.5
Citizens abroad	42,069	37,497	38,377	39,309	40,284	41,258
Non-citizens in Botswana	15,667	29,557	30,250	30,985	31,754	32,522
Population below 15 yrs	440,834	567,470	580,782	594,892	609,649	632,634
Population above 65 yrs	47,933	65,454	66,949	68,159	69,825	71,540
Urban Population	159,614	606,328	627,664	649,750	672,614	696,282
Rural Population	781,413	720,468	730,256	741,162	752,800	763,570
Number of Households	170,833	276,209	287,567	299,056	311,922	324,749
Average Size of Household	5.5	4.7	4.7	4.6	4.5	4.5
Live births	45,026	52,351	52,416	52,437	52,598	52,759
Crude birth rate (a)	47.8	39.4	38.6	37.7	36.9	33.7
Total fertility rate (b)	6.6	4.2	4.2	4.1	4.1	4.1
Deaths	12,835	15,221	15,344	15,578	15,822	15,926
Crude death rate (a)	13.0	11.5	11.3	11.2	11.1	11.0
Infant mortality rate (c)						
Male	80.9	47.9	46.6	45.4	44.2	43.0
Female	62.2	46.1	44.9	43.7	42.5	41.4
Total	71.0	48.0	46.7	45.5	44.3	43.1
Life expectancy at birth (years)						
Male	52.1	63.3	63.6	63.9	64.2	64.5
Female	59.0	67.1	67.4	67.6	67.9	68.1
Total	56.2	65.3	65.6	65.9	66.1	66.4
Annual Rate of Natural Increase (%)	3.4	2.8	2.7	2.5	2.4	2.3
Annual Rate of Population Growth(%)	4.6	3.5	3.3	3.1	2.9	2.7

Notes:
(a) - Birth/Death per 1,000 population.
(b) - Average live births per female (Based on point estimate).
(c) - Deaths per 1,000 live births.
1991 are census figures.
Figures for 1992 onwards are projections based on the 1991 census data.

TABLE 1.2 TOTAL POPULATION BY DISTRICTS AND DENSITY
