1.0 PREFACE

This statistical release presents quarterly Indices of Mining Production (IMP) for the period 2003 to the first quarter of 2017. Also carried in the report is the annual IMP for the period 2003 to 2016, derived as the average of the four quarters of the year. This report uses 2013 as a reference or base year. Data used in this publication is sourced from the Department of Mines; Ministry of Minerals Resources, Green Technology and Energy Security.

Stakeholders should note that as a result of editing and revision of data, figures on the previous quarterly stats brief and those on the current brief (for the corresponding period) may differ.

For more information, contact the Directorate of Stakeholder Relations at 3671300. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Anna N. Majelantle
Statistician General
July 2017

2.0 Summary Of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for Indices of Mining Production (IMP) from 2013 to the first quarter of 2017. This table forms the basis for the discussions under Sub-Section 2.1. Reference however, will be made to this table and other tables throughout the report.

Table 1: Key Figures in the Volume of Mining Production

Base Period : 2013=100			
Period	Index of the physical volume of mining production	Year-on-year percentage change	Quarter-on-Quarter percentage change
Q1_2013	82.5	(8.7)	(9.7)
Q2_2013	111.6	25.2	35.3
Q3_2013	97.1	38.4	(12.9)
Q4_2013	108.8	19.1	12.0
Q1_2014	96.2	16.7	(11.5)
Q2_2014	106.6	(4.5)	10.8
Q3_2014	105.7	8.9	(0.8)
Q4_2014	104.5	(4.0)	(1.2)
Q1_2015	95.6	(0.7)	(8.6)
Q2_2015	98.7	(7.4)	3.3
Q3_2015	65.6	(37.9)	(33.5)
Q4_2015	77.9	(25.5)	18.7
Q1_2016	90.1	(5.7)	15.7
Q2_2016	86.0	(12.9)	(4.5)
Q3_2016	73.7	13.4	(13.5)
Q4_2016	82.4	5.8	10.7
Q1_2017	77.1	(14.4)	(6.4)

Note: () denotes negative numbers

2.1 Indices of Mining Production

Table 1 shows that the Index of Mining Production stood at 77.1 in the first quarter of 2017 showing a year-on-year decline of **14.4 percent** from 90.1 during 2016 first quarter. The quarter-on-quarter analysis gives a decline of **6.4 percent** from 82.4 during 2016 fourth quarter.

The closure of the three copper-nickel mines as well as unstable world commodity prices for all minerals are the major factors that contributed negatively to the growth of mining production during the first quarter of 2017.

Table 6 give contributions of the various minerals in percentage points, to the year-on-year percentage change in the volume of the physical volume of mining production and forms the basis of the discussions below.

The main contributors to the decline in the year-on-year percentage change in the physical volume of mining production during the first quarter of 2017 were copper-nickel-cobalt matte contributing negative **11.3 percentage** points followed by diamonds and Soda Ash with **2.4 percentage** points and **0.5** of a **percentage** point respectively.

Even though coal production had a positive year-on-year percentage change (**Table 5**), this was not able to make a positive contribution (% points) to the overall year-on-year percentage change in the volume of mining production due to its insignificant weight in the index (**Table 6**).

2.2 Mineral Production

Discussions on mineral production, which compare production during the first quarter of 2017 to the same quarter of 2016, are based on **Table 2** and **Table 5**. **Table 4** provides quarter-on-quarter analysis of the mineral production and is the basis for comparison of production during the quarter under review and the preceding quarter.

Diamond production recorded a decrease of **2.7 percent** during the first quarter of 2017 as compared to the first quarter of 2016. The decline was largely due to the mining of lower grades diamonds in Jwaneng mine as well as maintaining business strategy to align production to trading conditions.

The quarter-on-quarter analysis shows that diamond production decreased by **5.0 percent** during the first quarter of 2017 when compared with production during the last quarter of 2016.

Gold production declined by **26.0 percent** in the first quarter of 2017 when compared to the same quarter of 2016. This decline was as a result of unstable commodity prices. The quarter-on-quarter production comparison shows a decrease of **37.2 percent** for production during the quarter under review when compared to 2016 fourth quarter production.

A decrease of **39.0 percent** in Soda Ash production was registered during the first quarter of 2017 when compared to the same quarter of 2016. The quarter-on-quarter comparisons reflects a decrease of **52.4 percent** during the period under review as compared to last quarter of 2016.

Salt production recorded a decrease of **31.7 percent** in the first quarter of 2017 when compared to the first quarter of 2016. The quarter-on-quarter comparison shows a decrease of **52.1 percent** in production during the first quarter of 2017 as compared to production during the last quarter of 2016.

The decline for both soda ash and salt is attributed to low commodity demand as well as the unstable commodity prices in the international markets.

Coal is the only commodity that recorded positive growth in production, increasing by **14.7 percent** in the first quarter of 2017 as compared to the corresponding quarter of 2016. However, the comparison of the first quarter of 2017 and fourth quarter of 2016 shows a decline of **9.6 percent**.

It is important to note that though Morupule power plant demand for coal resulted in the year-on-year increased demand for the commodity, the closure of the BCL mine in the last quarter of 2016 (one of the local markets for the commodity) negatively affected the coal production leading to low coal production in the first quarter of 2017.

Copper-Nickel-Cobalt Matte, Silver and Copper in Concentrates recorded zero production during the period under review. The instability and uncertainty of commodity prices had negatively affected the mines, leading to the provisional liquidation of the concerned companies.

Table 2: Index of Mining Production for the latest Quarter by Mineral Groups and Minerals

Base: 2013=100					
Mineral	Weights (2013)	Jan-Mar, 2016	Jan-Mar, 2017	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production
Diamonds	82.5	93.9	91.3	(2.7)	(2.4)
Copper-Nickel-Cobalt Matte	8.6	119	n.a	(100.0)	(11.3)
Copper in Concentrates	5.5	n.a	n.a	n.a	n.a
Gold	1.4	60.0	46.7	(26.0)	(0.2)
Soda Ash	0.9	117.9	71.9	39.0	(0.5)
Salt	0.5	67.3	46.0	(31.7)	(0.1)
Silver	0.4	n.a	n.a	n.a	n.a
Coal	0.3	114.4	131.2	14.7	0.05
Total	100	90.1	77.1	(14.4)	(14.4)

NB: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.

2. () denotes negative numbers

3. n.a signifies data not available/no production at the specified period.

Note: 1. (.) denote negative numbers

2. ...data is not zero but the figure is not significant enough to be measured

3. n.a signifies data not available/no production at the specified period

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi-Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real gross domestic product (GDP), contributing between 30 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time. Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of change in the production of minerals in Botswana cannot be over emphasized. The index of physical volume of mining production is such a measure that provides a relative change over time in mining production. IMP can also be used as a deflator to calculate the gross domestic product (GDP) at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals occurring naturally as solids such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons but for comparisons between countries.

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period, also referred to as reference period used in this brief is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular month.

The data produced is not seasonally adjusted. However there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-year percentage change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.7 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the ith item for the quarter has been calculated by using the formula:

$$(R_i) = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_{ic} is the production of the i^{th} item in the current quarter and P_{i0} is the production of the i^{th} item in the base year.
