GENERAL OUT-PATIENT AND PREVENTIVE HEALTH

Statistics Brief | 2018

Preface

This is the sixth statistical brief which focuses on the General Out-Patient and Preventive Health Statistics in Botswana. The information is derived from administrative data from patients who consulted medical personnel at health facilities country wide in 2018. It also shows the trends in Out-Patient statistics over a ten year period covering 2008 to 2018. The information provided should help in health policy formulation monitoring and evaluation purposes.

The report shows that between 2017 and 2018 Out-Patient attendees on Notifiable diseases increased from 399,867 to 451,537; Sexually Transmitted Diseases (STI's) increased from 487,016 to 515,812. Ante Natal Care patients increased from 339,529 in 2017 to 367,489 in 2018, Other Diseases increased from 3,666,337 to 3,667,421. Outpatient attendees for other services like Family Planning, Well Baby Care, Injections and Dressings have also shown some increases.

For more information and further enquiries, contact the Directorate of Stakeholder Relations on +267 367 1300. This publication, and all other Statistics Botswana outputs/publications are available on the website at (<http://www.statsbots.org.bw>) and at the Statistics Botswana Information Resource Centre (Head-Office, Gaborone).

We sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of our statistical products and services.

Dr. Burton Mguni
Statistician General

1.0 Introduction

This statistical brief analyses administrative data from all health facilities in Botswana providing Out-Patient and Preventive Health Care. Out-Patient care is a medical procedure, tests and services that can be provided to patients in a setting that doesn't involve an overnight stay. All the 738 health facilities (35 Hospitals, 357 clinics, 346 health posts) and 1,117 mobile stops provide Out-Patient care in Botswana. Data is aggregated using the Out-Patient and Preventive Health Statistics. Data is aggregated using the Out-Patient and Preventive Health Statistics Data Collection Tools which were implemented in response to the introduction of the International Classification of diseases 10th Edition (ICD) codes.

A consultation is either recorded as a new or repeat case. A new consultation refers to a case where a patient is seeking health services for a condition for the first time, whereas repeat refers to a case where a patient is getting health service for the same condition for the second time, or several times.

2.0 SUMMARY OF FINDINGS

2.1 Out-Patient Morbidity

Table 2.1.1 shows the top ten causes of morbidity in 2018. A total of 4,634,770 disease/ conditions were recorded for outpatient attendances in 2018, which is an increase of 1.8 percent from 4,553,220 conditions recorded in 2017. New cases constituted 64.7 percent of all attendances. The highest cause of reported morbidity was Other diseases/conditions (34.9%), followed by Hypertension (12.2%), and Diseases of the Musculoskeletal System (11.1%). These top three conditions were also identified in 2017. All diseases/conditions in the 2017 top ten list appear in the 2018 list except for Ear diseases/conditions which do not form part of the top ten conditions in 2018.

Code	Disease	2018			2017

Others			507,392	10.9		522,964	11.5
Total			4,634,770	100		4,553,220	100

2.2 Sexually Transmitted Infections

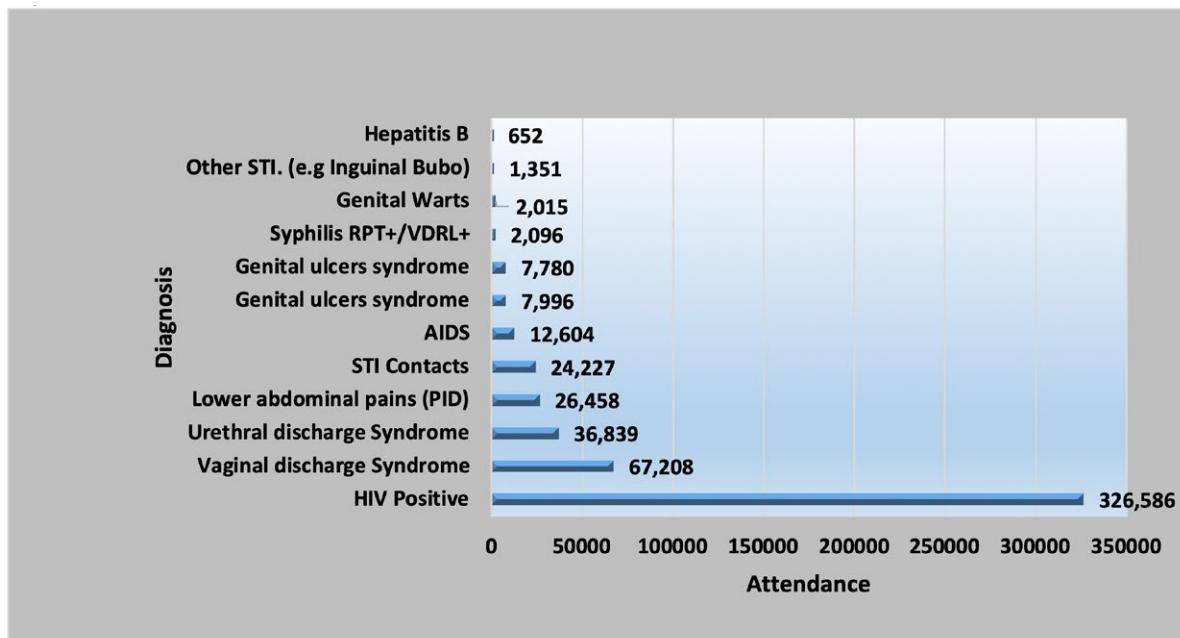

A total of 515, 812 sexually transmitted attendances were recorded in 2018. This is an increase of 5.9 percent from 487, 016 cases recorded in 2017. Out of the 515,812 total attendances, 51 percent (166,673) were new attendances. Figure 2.2.1 equally shows an increase in the number of STI attendance from 2014 to 2016 followed by a slight decline of 0.7 percent in 2017, before registering an increase in 2018.

Figure 2.2.1 Number of Sexually Transmitted Infections 2014-2018

Figure 2.2.2 shows distribution of STI attendance in 2018 by type. The highest recorded attendances were those who were HIV positive (63.3%) followed by those presenting Vaginal discharge Syndrome (13.1%), and Urethral discharge Syndrome (7.1%). The distribution of cases was higher among females (63.5%) compared to their counter parts. Among the age groups, STI cases were higher within the age group 30 years and above (71.8%), and the lowest for age group 0-14 at 2 percent (Refer to Table 3.1c).

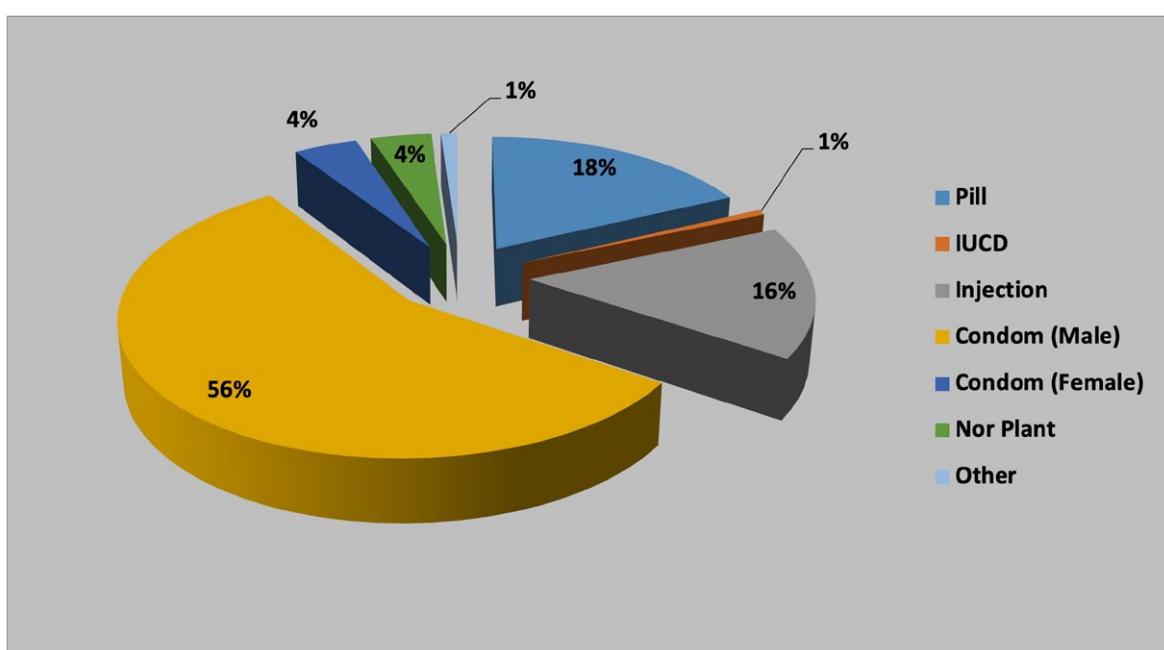

Figure 2.2.2 Sexually Transmitted Infections (STI's) Attendances -2018

2.3 Family Planning (FP)-2018

According to the World Health Organisation, "Family planning allows individuals and couples to anticipate and attain their desired number of children and the spacing and timing of their births. It is achieved through use of contraceptive methods and the treatment of involuntary infertility. The Figure 2.3.1 shows the distribution of family planning attendances by the preferred method of contraception. A total of 365,839 attendances were recorded in 2018, which is an increase of 0.4 percent from 364,534 attendances recorded in 2017. New attendances were 64,638 (17.7%) compared to repeat attendances 301,201 (82.3%). The preferred method of contraception was male condom (56%) followed by Pill (18%) and the least being IUCD (1%).

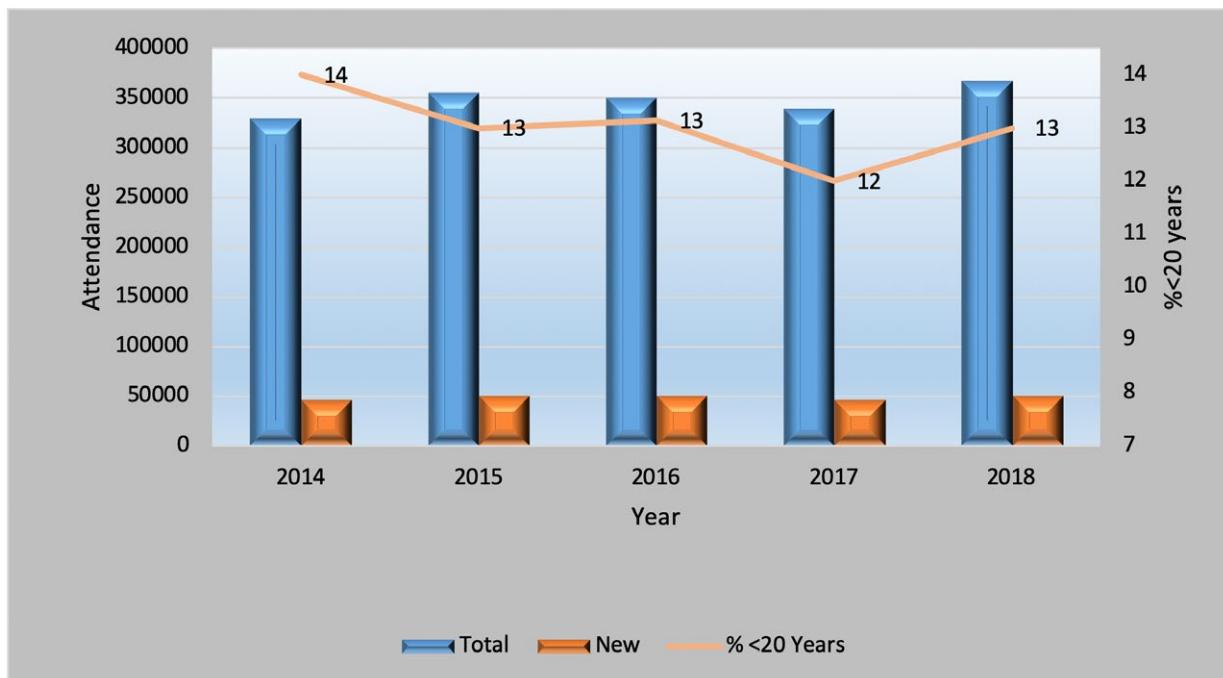

Figure 2.3.1 Percentage Distribution of Family Planning Attendances-2018

2.4 Ante Natal Care (ANC)

Antenatal care is the care given to mothers from health professionals during pregnancy. It's sometimes called pregnancy care or maternity care. It is offered through appointments with a midwife, or sometimes a doctor who specialises in pregnancy and birth (an obstetrician). The total ANC visits for 2018 stood at 367,489 of which 50,006(13.6%) were new attendances. This is an increase of 8.2 percent from 2017. The majority of new attendances were in the age group 30-39 (30.8%), followed by the age group 20-24 (27.2%), and age group 25-29 (24.9%). Figure 2.4.1 shows a fluctuating trend in ANC visits over the five year period. ANC attendances for those less than 20 years stood at 6,469 (13%) of new attendances. Figure 2.4.1 further reflects a fluctuating trend in the percentage attendance for those less than 20 years.

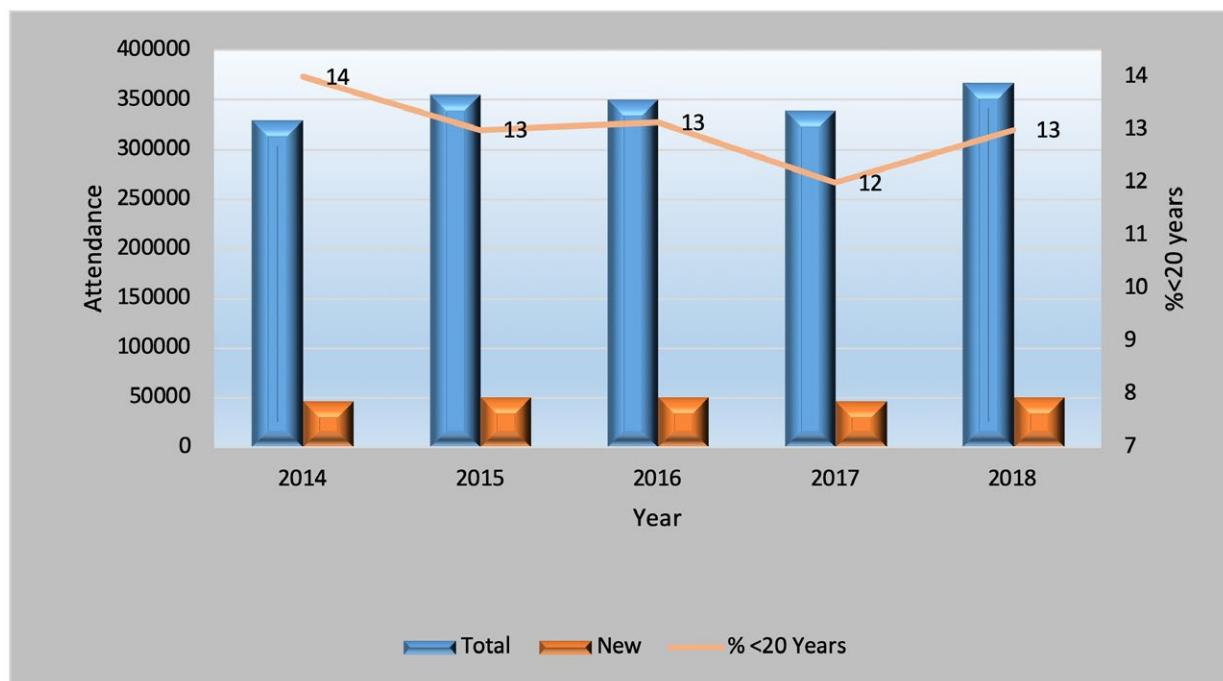

Figure 2.4.1: Number of ANC Visits 2014-2018

2.5 Notifiable Diseases

A notifiable disease is any disease that is required by law to be reported to government authorities. Confirmed Malaria, diarrhea and suspected measles are some of the communicable diseases that should be reported at the earliest time to the health authorities. Reporting of these diseases allows the authorities to monitor the diseases and provide for early warning of possible outbreaks. Figure 2.5.1 shows number of confirmed malaria and suspected measles cases between 2008 and 2018. Generally the figure reflects marginal fluctuations across the years for both malaria and suspected measles cases. A decrease is observed for malaria cases between the last two years, recording 553 malaria cases in 2018 compared to 1,882 cases in 2017. The number of suspected measles recorded a peak in 2010 (8,605 cases) followed by 4,205 and 3,441 cases in 2014 and 2011, respectively.

Figure 2.5.1: Trends in Selected Notifiable Diseases, Botswana 2014-2018

A total of 13,208 diarrhea cases was reported in 2018 resulting in 51 deaths. This is an increase of 26.5 percent from 10,441 cases recorded in 2017. Generally the total number of reported diarrhea cases has been decreasing since 2008. An increase/decrease in diarrhea cases yields an increase/decrease in deaths. During the periods, 2011-2012 an inverse relation is observed where the number of deaths increased over a decade in number of diarrhea cases.

Figure 2.5.2: Trends in Out-Patient Attendances and deaths for Diarrhea, Botswana 2008-2018

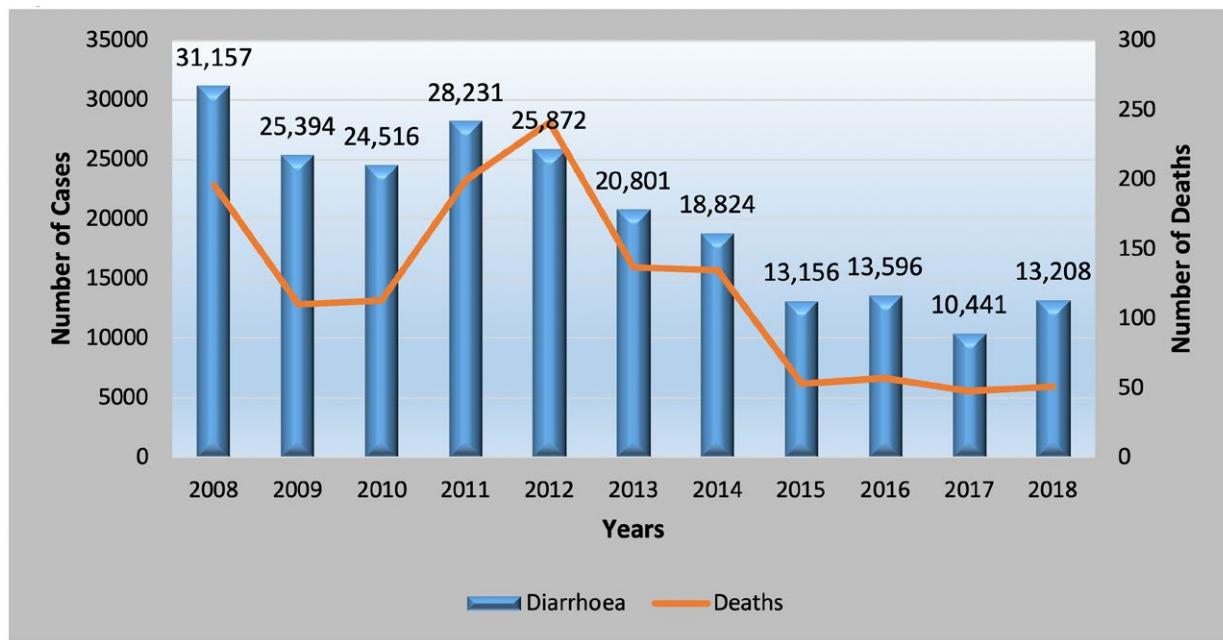

Figure 2.5.3 shows the diarrhea case fatality over the ten-year period. Diarrhea Case fatality rate is defined as the probability of death among cases diagnosed with diarrhea. The case fatality rate is often used as a measure of severity of illness. Diarrhea Case Fatality for 2018 was 3.9 deaths per 1,000 diarrhea cases, an increase from 4.6 deaths per thousand recorded in 2017. Case fatality rates have been fluctuating over the years. The graph shows that the severity of diarrhea was high in 2012 (9.3) and low in 2015 (4.0), 2016 (4.2) and 2018 (3.9).

Figure 2.5.3: Case Fatality Rate (Per 1,000)

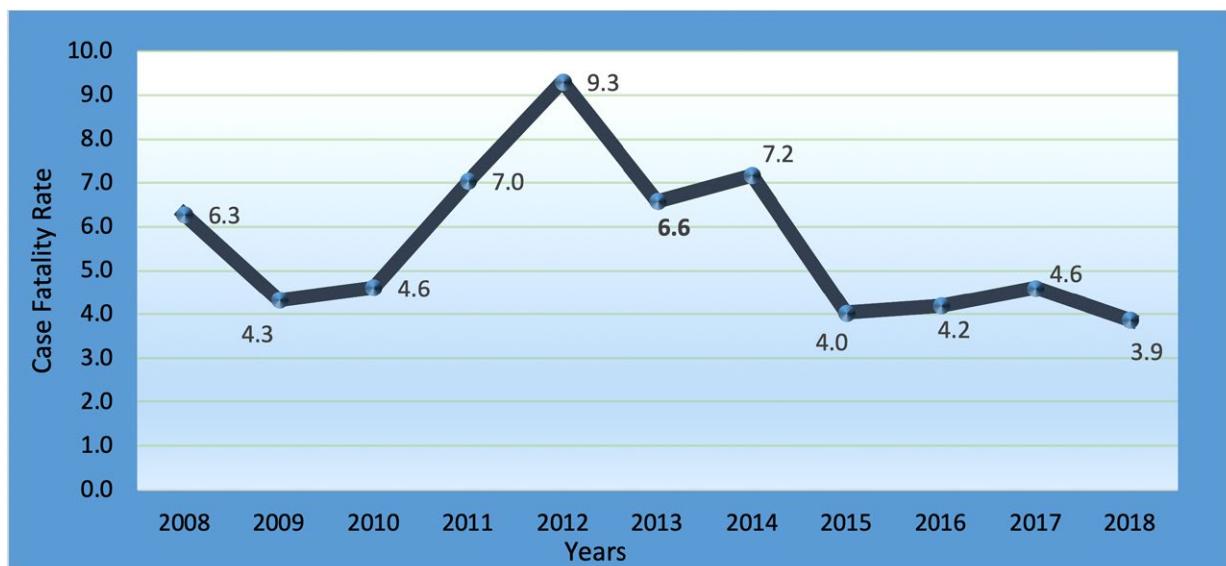

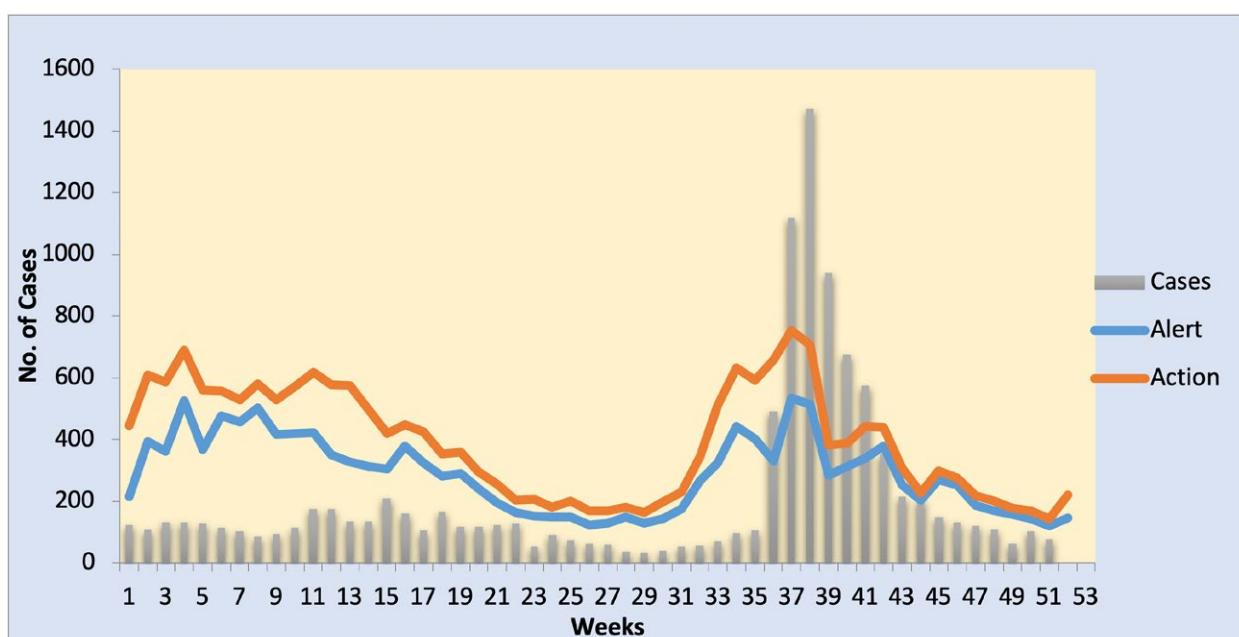

Figure 2.5.4 shows the National diarrhea thresholds for 2018. These thresholds serve as a reference point for health officials to be on alert and take action if there is an outbreak of diarrhea in the country. In 2018, Diarrhea threshold was higher for alert from week 36 to 42 and higher for action from week 37 to 42. This is an indication that the country was on alert from week 36 and the onset of the outbreak started from week 37 to 42. The highest number of cases was recorded in week 38 (1,474 cases) and the lowest in week 29(32 cases).

Figure 2.5.4: National Diarrhea Threshold 2018
