------------------	---	---

1.0 Preface

This statistical release presents quarterly Indices of Mining Production (**IMP**) for the period 2012 to the first quarter of 2018. Also carried in the report is the annual **IMP** for the period 2012 to 2017, derived as the average of the four quarters of the year. This report uses 2013 as a reference year. Data used in this publication is sourced from the Department of Mines under the Ministry of Mineral Resources, Green Technology and Energy Security.

For more information, contact the Directorate of Stakeholder Relations on (+267) 367 -1300. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Dr Burton Mguni
Statistician General
June 2018

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for Indices of Mining Production (**IMP**) from the first quarter of 2013 to the first quarter of 2018. This table forms the basis for the discussions under Sub-Section 2.1. Reference, however, will be made to this table and other tables throughout the report.

2.1 Indices of Mining Production

The Index of Mining Production stood at **86.9** during the first quarter of 2018 showing a year-on-year increase of 12.6 percent from 77.1 during the first quarter of 2017. The main contributor to the 12.6 percent increase were Diamonds contributing 11.2 percentage points, followed by Gold and Soda Ash contributing 0.6 and 0.5 of a percentage point respectively, as shown in **Table 2**.

The quarter-on-quarter analysis reflects an increase of **4.9** percent from the index of 82.8 during the fourth quarter of 2017 to 86.9 observed in the reference period.

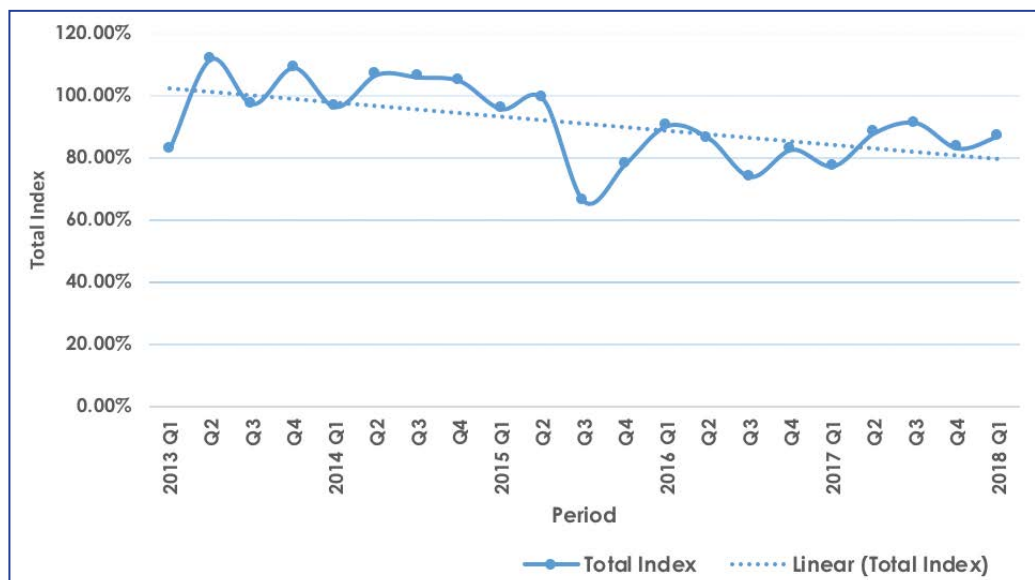

Table 1: Key Figures in the Volume of Mining Production

Base Period : 2013=100			
Period	Index of the physical volume of mining production	Year-on-year percentage change	Quarter-on-Quarter percentage change
Q1_2013	82.5	(8.7)	(9.7)
Q2_2013	111.6	25.2	35.3
Q3_2013	97.1	38.4	(12.9)
Q4_2013	108.8	19.1	12.0
Q1_2014	96.2	16.7	(11.5)
Q2_2014	106.6	(4.5)	10.8
Q3_2014	105.7	8.9	(0.8)
Q4_2014	104.5	(4.0)	(1.2)
Q1_2015	95.6	(0.7)	(8.6)
Q2_2015	98.7	(7.4)	3.3
Q3_2015	65.6	(37.9)	(33.5)
Q4_2015	77.9	(25.5)	18.7
Q1_2016	90.1	(5.7)	15.7
Q2_2016	86.0	(12.9)	(4.5)
Q3_2016	73.7	12.3	(14.3)
Q4_2016	82.4	5.8	11.8
Q1_2017	77.1	(14.4)	(6.4)
Q2_2017	87.9	2.1	13.9
Q3_2017	91.0	23.4	3.5
Q4_2017	82.8	0.5	(9.0)
Q1_2018	86.9	12.6	4.9

Note: () denotes negative numbers

Figure 1 shows the graphical presentation of the Total Index from the first quarter of 2013 to the first quarter of 2018. The graph shows that despite the fluctuations observed over the period covered, on average, it is observed that production trend between 2013 and 2018 has been declining.

Figure 1: Percentage Change from Quarter to Quarter for the Total Index of Mining Production – 2013-2018)

2.2 Mineral Production

Discussions on mineral production, which compare production during the first quarter of 2017 to the same quarter of 2018, are based on **Table 2** and **Table 5**. **Table 4** provides quarter-on-quarter analysis of the mineral production, for the quarter under review, giving comparison to the preceding quarter.

Diamond production showed a growth of 11.5 percent during the first quarter of 2018 compared to a negative growth of 2.7 percent recorded during the same quarter of the previous year. The increase was as a result of sustained healthy trading conditions. The quarter-on-quarter analysis shows that diamond production expanded by 5.7 percent in the first quarter of 2018 compared to the fourth quarter of 2017, the increase resulted from the favourable international prices for diamonds.

Gold production continued to rise for the third consecutive quarter. It increased by 68.7 percent in the first quarter of 2018 compared to negative 22.1 percent registered in the first quarter of 2017. The increase was as a result of higher than expected recoveries from the ore despite the reduction of the lifespan of the mine. The quarter-on-quarter analysis on the other hand reflects a decrease of 13.2 percent in the first quarter of 2018 compared with the preceding quarter.

Soda Ash production increased by 57.4 percent during the first quarter of 2018. The increase was realised despite low demand of the commodity by the international markets. The quarter-on-quarter comparisons, however, reflects a decline of 17.3 percent during the period under review compared to the last quarter of 2017.

Salt production increased by 43.5 percent in the first quarter of 2018 compared to production during the same quarter of the previous year. Production increased although there were some transportation challenges for the commodity to reach the international markets. The quarter-on-quarter comparison, on the other hand decreased by 17.0 percent in the first quarter of 2018 compared to the fourth quarter of 2017.

Coal production recorded an increase of 21.7 percent in the first quarter of 2018 compared to the same quarter of the previous year. Although an increase was realised, Morupule B has been experiencing operational challenges as two of the boilers are currently out of service. The quarter-on-quarter comparison, reflects an increase of 5.5 percent compared to the preceding quarter. The increase in production was primarily to meet international demand for the commodity.

Copper in concentrates production registered a decrease of 35.7 percent in the first quarter of 2018 compared with the preceding quarter. Although production decreased for the quarter, it should be noted that the mine was operating for the third consecutive quarter following halt of production between the last quarter of 2015 and the second quarter of 2017. It should further be noted that the mine stock piled the commodity in order to guard against any shortfalls in meeting supply obligations.

Copper-Nickel-Cobalt Matte and Silver recorded zero production during the period under review. The instability and uncertainty of commodity prices had negatively affected the mines, therefore finding it difficult to sustain themselves at the current prices as a result leading to the provisional liquidation of the concerned companies.

Table 2: Index of Mining Production for the latest Quarter by Mineral Groups and Minerals

Base:2013=100					
Mineral	Weights (2013)	Jan-Mar, 2017	Jan-Mar, 2018	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production
Diamonds	82.5	91.3	101.8	11.5	11.2
Copper-Nickel-Cobalt Matte	8.6	n.a	n.a	n.a	n.a
Copper in Concentrates	5.5	n.a	1.9	...	0.1
Gold	1.4	46.7	78.9	68.7	0.6
Soda Ash	0.9	71.9	113.2	57.4	0.5
Salt	0.5	46.0	66.0	43.5	0.1
Silver	0.4	n.a	n.a	n.a	n.a
Coal	0.3	131.2	159.7	21.7	0.1
Total	100	77.1	86.9	12.6	12.6

- NB: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.
 2. n.a signifies data not available/no production at the specified period.
 3. ...data is not necessarily zero but the figure is not big enough to be measured with the smallest unit

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi-Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real gross domestic product (GDP), contributing between 30 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of change in the production of minerals in Botswana cannot be over emphasized. The index of physical volume of mining production is such a measure that provides a relative change over time in mining production. IMP can also be used as a deflator to calculate the gross domestic product (GDP) at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals occurring naturally as solids such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Silver, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons but for comparisons between countries.

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period, also referred to as reference period used in this brief is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular month.

The data produced is not seasonally adjusted. However there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-year percentage change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.7 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where;

I is the index,

R_i is the production relative of item i and

W_i is the weight allocated to item i

The production relative (R_i) of the i th item for the quarter has been calculated by using the formula:

$$R_i = \frac{P_{ic}}{P_{io}} * 100$$

Where

P_{ic} is the production of the i^{th} item in the current quarter, and

P_{io} is the production of the i^{th} item in the base year.
