------------------	--	---

1.0 Preface

This statistical release presents quarterly Indices of Mining Production (**IMP**) for the period 2012 to the first quarter of 2020. Also carried in the report are the annual **IMP** for the period 2012 to 2019, derived as the average of the four quarters of the year. This report uses 2013 as a reference year. Data used in this publication are sourced from the Department of Mines under the Ministry of Mineral Resources, Green Technology and Energy Security.

The Index of Mining Production stood at 84.6 during the first quarter of 2020, showing a year-on-year decrease of 5.6 percent from the index of 89.6 recorded during the first quarter of 2019. Comparison on a quarter-on-quarter basis shows a decrease of 3.7 percent, from the index of 87.8 realised during the fourth quarter of 2019 to 84.6 registered during the first quarter of 2020.

The release further shows the contribution of each mineral and mineral group to the Year-on-Year Percentage Change in the Volume of Mining Production, and hence provides a reflection of the trend in the local mining sector.

Statistics Botswana is mandated to compile data on industrial production in Botswana, hence the Index of Mining Production is only confined to minerals extracted across the country. This is intended to monitor the performance of the mining sector in Botswana.

For more information, contact the Directorate of Stakeholder Relations on (+267) 3671300. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Malebogo Kerekang
Acting Statistician General
July 2020

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for the Index of Mining Production (**IMP**) from the first quarter of 2013 to the first quarter of 2020. This table forms the basis for the discussions under Sub-Section 2.1. Reference, however, will be made to this table and other tables throughout the report.

2.1 Index of Mining Production

The Index of Mining Production stood at **84.6** during the first quarter of 2020, showing a year-on-year decrease of 5.6 percent from 89.6 registered during the first quarter of 2019. The main contributor to the 5.6 decline in the Index of Mining Production were Diamonds contributing negative 5.5 percentage points as shown in **Table 2**.

The quarter-on-quarter analysis shows a decrease of 3.7 percent, from the index of 87.8 during the fourth quarter of 2019 to 84.6 observed during the reference period.

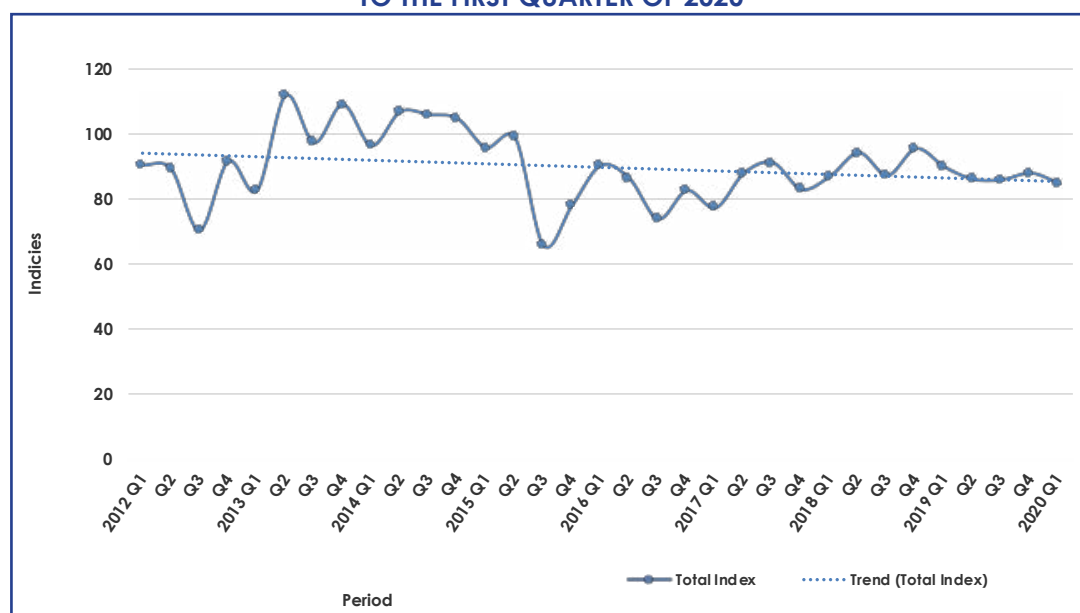

Table 1: Key Figures in the Volume of Mining Production

Base Period : 2013=100				
Period	Index of the physical volume of mining production	Year-on-Year percentage change	Quarter-on-Quarter percentage change	
Q1_2013	82.5	(8.7)	(9.7)	
Q2_2013	111.6	25.2	35.3	
Q3_2013	97.1	38.4	(12.9)	
Q4_2013	108.8	19.1	12.0	
Q1_2014	96.2	16.7	(11.5)	
Q2_2014	106.6	(4.5)	10.8	
Q3_2014	105.7	8.9	(0.8)	
Q4_2014	104.5	(4.0)	(1.2)	
Q1_2015	95.6	(0.7)	(8.6)	
Q2_2015	98.7	(7.4)	3.3	
Q3_2015	65.6	(37.9)	(33.5)	
Q4_2015	77.9	(25.5)	18.7	
Q1_2016	90.1	(5.7)	15.7	
Q2_2016	86.0	(12.9)	(4.5)	
Q3_2016	73.7	12.3	(14.3)	
Q4_2016	82.4	5.8	11.8	
Q1_2017	77.1	(14.4)	(6.4)	
Q2_2017	87.9	2.1	13.9	
Q3_2017	91.0	23.4	3.5	
Q4_2017	82.8	0.5	(9.0)	
Q1_2018	86.9	12.6	4.9	
Q2_2018	94.0	7.0	8.3	
Q3_2018	87.1	(4.2)	(7.4)	
Q4_2018	95.3	15.1	9.4	
Q1_2019	89.6	3.1	(6.0)	
Q2_2019	85.9	(8.7)	(4.1)	
Q3_2019	85.8	(1.5)	(0.1)	
Q4_2019	87.8	(7.9)	2.3	
Q1_2020	84.6	(5.6)	(3.7)	

Note: () denotes negative numbers

Figure 1 shows the graphical presentation of the Total Index from the first quarter of 2012 to the first quarter of 2020. The graph shows that, on average, production has been declining gradually, between the years 2012 and 2020.

FIGURE 1: TOTAL INDEX OF MINING PRODUCTION FOR THE FIRST QUARTER OF 2012 TO THE FIRST QUARTER OF 2020

2.2 Mineral Production

Discussions on mineral production, which compare production during the first quarter of 2020 to the same quarter of 2019, are based on **Table 2** and **Table 6**. **Table 5** provides analysis of the mineral production, for the quarter under review, giving comparison to the preceding quarter.

Diamond production declined by 5.7 percent during the first quarter of 2020 compared to the same quarter of the previous year. At the same time, the quarter-on-quarter analysis shows that production registered a negative growth rate of 4.0 percent during the first quarter of 2020 compared to the preceding quarter. The decline is attributable to mining of lower grade ore from one of the key operating mines and challenges experienced by the other mine in relation to commissioning of the new plant infrastructure.

Gold production increased by 7.2 percent during the first quarter of 2020, after declining for the four consecutive quarters of 2019. The positive growth was as a result of higher than expected gold recoveries from the ore which came at a time where gold prices were showing some improvement. On the other hand, quarter-on-quarter analysis reflects a decrease of 0.5 percent during the first quarter of 2020 compared to the fourth quarter of 2019.

Soda Ash production declined for the third consecutive quarter, decreasing by 12.8 percent during the first quarter of 2020, compared to the same quarter of the previous year. The decrease in production is attributable to the inefficiency of the plants to operate at full capacity. On the other hand, the quarter-on-quarter analysis shows that Soda Ash production increased by 3.1 percent during the period under review.

Salt production increased by 2.5 percent during the first quarter of 2020, after declining during the previous two quarters. The increase was in response to high demand of the commodity by the regional markets. The quarter-on-quarter comparison, shows an increase of 15.3 percent during the period under review.

Coal production increased by 4.9 percent compared to the same quarter in 2019. The increase was a result of the efforts made to meet both the international and domestic demand, particularly that Morupule A Power Plant has started operating in order to augment electricity produced by Morupule B Power Plant which has resumed remedial works on the boilers. Comparison of production during the first quarter of 2020 and the fourth quarter of 2019 shows a 27.3 percent increase.

Copper-Nickel-Cobalt Matte, Copper in Concentrates and Silver recorded zero production during the period under review. The instability and uncertainty of commodity prices affected production at the associated mines, leading to provisional liquidation as mining operations could not be sustained at the current prices.

Table 2: Index of Mining Production for the latest Quarter by Mineral Groups and Minerals

Base:2013=100					
Mineral	Weights (2013)	Jan-Mar 2019	Jan-Mar 2020	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production
Diamonds	82.5	105.1	99.2	(5.7)	(5.5)
Copper-Nickel-Cobalt Matte	8.6	n.a.	n.a.	n.a.	n.a.
Copper in Concentrates	5.5	n.a.	n.a.	n.a.	n.a.
Gold	1.4	65.6	70.3	7.2	0.1
Soda Ash	0.9	129.8	113.1	(12.8)	(0.2)
Salt	0.5	85.5	87.7	2.5	0.0
Silver	0.4	n.a.	n.a.	n.a.	n.a.
Coal	0.3	148.3	155.6	4.9	0.0
Total	100	89.6	84.6	(5.6)	(5.6)

- Note: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.
 2. () denotes negative numbers
 3. n.a. signifies data not available/no production during the specified period.

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs, which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real Gross Domestic Product (GDP), contributing between 20 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time. Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP, according to the quarterly GDP reports produced by Statistics Botswana. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of the change in the production of minerals in Botswana cannot be over emphasised. The index of the physical volume of mining production is such a measure that provides a relative change over time in mining production. The IMP can also be used as a deflator to calculate the GDP at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Silver, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and the Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons, but for comparisons between countries.

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production, which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period used in this brief, is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular period.

The data produced are not seasonally adjusted. However, there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-Year Percentage Change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Quarter-on-Quarter percentage change

Quarter-on-Quarter percentage change in a variable for any given period is the rate of change expressed over the previous quarter.

4.7 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.8 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the i^{th} item for the quarter has been calculated by using the formula:

$$R_i = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_{ic} is the production of the i^{th} item in the current quarter and P_{i0} is the production of the i^{th} item in the base year.
