PREFACE

The present volume of Medical Statistics Unit report covering the calendar years 1980 and 1981 is the sixth in a series of publications which have been produced by the Medical Statistics Unit since 1975.

We would like to express our apology for the delay involved in the publication of the 1980/81 issue. In line with our policy to disseminate information to various data users as quickly as possible, attempts are being made to improve the timely publication and distribution of future reports. In any case, data users can always consult the Medical Statistics Unit for pre-publication data.

The 1980/81 report includes the latest available information on the size and structure of population, health expenditures, health facilities and personnel, out-patient and in-patient services and mental health.

The information presented in this report is based on reports received from all health facilities throughout the country. The 1980/81 report shows a large increase in out-patient attendances which is due mainly to an increase in the number of health facilities in rural areas. Though the coverage varies from medical region to region, this is due to the population distribution and migration patterns of the population of Botswana. At present, over 90% of the population has access to health care - this is being taken care of by the many mobile clinics which operate throughout the country.

The information reported by various health units was processed manually and summarised with the help of the minicomputer. All information reported has been summarised and shown in a series of tables according to type of services offered, type of patient, etc. This was done mainly to assess the work load of each health facility by type, coverage and type of services it is rendering as compared to other health facilities in the country. In presenting the information, all health centres clinics, health posts and mobile stops have been grouped together. Any information relating to any particular unit mentioned may be obtained from the Medical Statistics Unit on request.

A.002017

Our grateful acknowledgements are due to all the health personnel in hospitals, clinics and health centres in the country without whose cooperation and assistance it will be possible to produce this report.

F. Modise
GOVERNMENT STATISTICIAN.

December, 1983

ACKNOWLEDGEMENT

The work of the Medical Statistics Unit would obviously not be possible without the co-operation of a large number of people, in particular the health personnel in hospitals, health centres, clinic etc., who provide raw data. This co-operation has always been forthcoming and is here gratefully acknowledged. Also, to the Regional Medical Officers, whose efforts have resulted in an improvement in the coverage, and thus, the accuracy of the Health Statistics.

On a more personal basis mention is made of the efforts of Mr. N. Shrestha and Mrs. P. Mguni in providing in-patient tables. Mr. P. Kelekwang provided tables on Health Units in operation, health personnel and health expenditures. The late Mr. M. Rayamajhi and Mr. P. Khulumani were responsible for the out-patient statistics tables with Mr. Maimela and others assisting them. Mrs. H. Leshupi was responsible for in-patient coding with Miss Chibane, Miss Phale and others assisting her.

The able leadership of Mr. F. Modise, the Government Statistician and Mr. M.G.K. Mooka, the Principal Statistician ensured a smooth working relationship between the Medical Statistics Unit, the Government Computer Bureau and the Central Statistics Office. This acknowledgement records with deep appreciation the reliable typing of the Unit's typist Miss P. Dipadi. There are many others, too many to mention who contributed to the success of Medical Statistics Report; their efforts are deeply appreciated.

Anna N. Moreri
ASSISTANT STATISTICIAN.

GOVERNMENT OF BOTSWANA

Drawn by the Department of Surveys and Lands, Gaborone.

INTRODUCTION

COVERAGE

The information presented in this report is based on reports received from all health facilities throughout the country. The 1980/81 report shows a large increase in out-patient attendance and this is due mainly to an increase in the number of health facilities in rural areas. Although the Coverage varies from medical region to region because of population distribution and migration patterns of the population of Botswana, at present, more than 90% of the population has access to health care since more mobile clinics now operate throughout the country. Gantsi District alone has more than 300 mobile stops even though the number of fixed health units are only few in that district.

METHODOLOGY

The information reported by various health units was processed manually and summarized with the help of a minicomputer. All information reported has been summarized and shown in a series of tables according to type of services offered, type of patients, etc. This was done mainly to assess the work load of each facility by type, and type of services it is rendering, the coverage, as compared to other health facilities in the country. In presenting the information, all health centres, clinics, health posts and mobile stops were grouped together. Any information relating to particular unit mentioned may be obtained from the Medical Statistics Unit on request.

SECTION 1

POPULATION

The population of Botswana in 1981 was 941 027. Table 1.1 gives a distribution by age and sex as well as percentage distribution . In table 1.2 the census population for 1981 is shown according to districts. For convenience of reference, urban and rural (districts) areas are grouped separately and with respective total populations. Table 1.3 shows total population by medical regions, indicating also the districts included in each. It may be noted that in the table small areas from certain districts are, in effect included in certain other regions. Thus for sake of simplicity, small areas of the Southern District which form part of Gaborone Region. Some areas of the South East District which are included in Lobatse Region and parts of Central District which are included in Maun Region are not shown as such. It will be recalled that the Ministry of Health has already planned to redemarcate regional boundaries to coincide with those of Administrative Districts.

The percentage distribution of 1981 census population is shown in table 1.4 according to age, sex and residence (rural, urban). Because of the lack of reliable information concerning population movements, especially rural- urban migration which is believed to be considerable, it has not been possible to provide the population classified by age and sex for medical regions and districts. In view of this, the percentages shown in Table 1.4 may be used as an approximate indicator of the magnitude of population in different age-sex and rural and rural - urban groups.

SECTION 2 HEALTH EXPENDITURE

Information concerning Government health expenditure both recurrent and development, is given in Tables 2.1 and 2.2. Recurrent expenditure on health is shown classified by agency responsible for the programme, in Table 2.1 for the years 1977/78 - 1980/81; similar information concerning development expenditure is shown in Table 2.2.

An analysis of the recurrent expenditure of the Ministry of Health is given according to major categories and items in Table 2.3 and a similar analysis of the development expenditure in Table 2.4

The Ministry of Health which is responsible for health policies, advisory services and the operation of hospitals, health centres and medical regional health teams spent P8 440 280 in 1979/80 and P11239 881 in 1980/81 on recurrent items. (i. e. 7.49% of the total national recurrent expenditure in 1980/81). In addition to this, Local Government agencies (District and Town Councils) spent P1 429 258 and P3 413 765 which formed 23.73% and 19.93% of the total recurrent expenditure of Local Government in 1979/80 and 1980/81 respectively or 1.27% and 2.09% of total national recurrent expenditure for 1979/80 and 1980/81 respectively.

SECTION 3IN-PATIENT STATISTICS

In-patient statistics is based on information collected on the Admission form/In-patient summary which is completed on discharges (alive or dead) or a patient from the hospitals, health centres and clinics with maternity wards(beds). The General In-patient statistics, do not include lodgers and normal new born infants. For practical reasons, the diagnosis of principal diseases or condition treated was alone coded and used for tabulation purposes.

Disease categories used in the tables follow the International Classification of Morbidity and Mortality. The age groups used represent a modified form of the recommended international grouping. An effort has been made to summarize the diagnostic information of major diseases and conditions which require hospitalization as well as causes of death.

Certain tables have been included to present details of major causes of both morbidity and mortality according to age groups.

In addition, tables are also included showing detailed analysis of cause of complications of pregnancy, childbirth and the puerperium, as well as of perinatal morbidity and mortality.

TOTAL: (1976-81	411	1	55	355	18	337

NOTES: 1. The Family Welfare Educators (FWE) Training courses are of 11-week duration and are normally held three times every year.

2. Prior to 1976, about 207 FWEs had been trained, so that there were 562 trained FWEs at the end of 1981.

SECTION 4

1. OUT-PATIENT SERVICES

During the years 1980 and 1981, various health units in the country reported a total number of 1 300 720 and 1 248 556 new attendances and 450 265 and 750 283 revisits respectively. Recent expansion of health facilities, especially in the rural areas, has led to an improvement in the coverage.

2. ANTE-NATAL CARE

During the years 1980 and 1981, 35 854 and 34 862 first visits, 132 694 and 135 271 revisits respectively of pregnant mothers were reported by all health facilities. This shows a slight drop in the number of first visits in 1981 as compared to 1980. The ratio of revisits to first visits was 3.71 in 1980 and 3.88 in 1981 signifying a possible improvement in the follow-up pattern of pregnant mothers at Ante-Natal clinics.

The above figures show a first attendance rate of 87% of expected number of pregnant women in 1980 and 82% in 1981. First attendances by rural expectant women was approximately 82% for 1980 and 73% for 1981. The total number of contacts made by pregnant women with the health facilities is of high level. However, the time of first contact is usually in the second semester, especially in rural health facilities. Motivation for the earlier start of antenatal care should be the priority message in all health facilities. Protection against neonatal tetanus through the administration of two doses of tetanus toxoid has become an established practice.

3. POST-NATAL CARE

During 1980, there were 6 944 post-natal attendances throughout the country as compared to 8 486 post natal attendances in 1981. This shows a percentage increase of 22.2. The rate of post-natal attendances continues to be a small percentage of the number of new ante-natal attendances (19.38 and 24.34 in 1980 and 1981 respectively). Attendances for first immunizations at 2 months was 65% of estimated births in 1980 and 74% in 1981.

If the post natal examinations were combined with this first contact for immunization of the child, the rate would improve and mothers would be relieved of the burden of two visits two weeks apart.

4. INFANT AND CHILD CARE

Infant and child care services routinely provided by health workers include the following:

- routine immunization of all infants delivered in health institutions against small pox and tuberculosis (BCG)
- routine check up of infants and children attending clinics for their growth and development.
- immunisations (DPT, Polio and Booster) of children attending child welfare clinics.
- nutrition surveillance programme

5. IMMUNIZATIONS

The data are collected using Tally Sheets and analysed by Expanded Programme for Immunization. The information concerning immunizations is shown in tables 4.9 and 4.10.

6. FAMILY PLANNING SERVICES

The family planning services continue to show an increase from year to year. In 1980 and 1981 there were 14 445 and 17 405 new visits, and 68 049 and 75 541 repeat visits respectively. The pill continues to be the most used method.

	1981	17 436	3 448	1 299	2 528	24 711	211 000	11.7	

NOTE: Following assumptions have been used to estimate acceptors-

1. An estimated 60% of all first visits would drop out during the year of acceptance, so that only 40% of all visits could be considered as regular users.
2. Number of visits for which FP method was 'NOT STATED' consists of women who seek advice as well as others who were diagnosed as having a disease or condition and referred for treatment. Some of them might subsequently accept FP, but they are considered to be only a few and hence not included in these calculations. Similarly, users of condoms were also left out of these calculations.
3. Among revisits, a third of those who chose loop (IUD) and a fourth of all other FP acceptors were considered to be regular or continuing acceptors for purposes of these estimates.

SECTION 5

IN-PATIENT STATISTICS

In-patient statistics is based on information collected on the Admission form/In-patient summary which is completed on discharges (alive or dead) or a patient from the hospitals, health centres and clinics with maternity wards(beds). The General In-patient statistics, do not include lodgers and normal new born infants. For practical reasons, the diagnosis of principal diseases or condition treated was alone coded and used for tabulation purposes.

Disease categories used in the tables follow the International Classification of Morbidity and Mortality. The age groups used represent a modified form of the recommended international grouping. An effort has been made to summarize the diagnostic information of major diseases and conditions which require hospitalization as well as causes of death.

Certain tables have been included to present details of major causes of both morbidity and mortality according to age groups.

In addition, tables are also included showing detailed analysis of cause of complications of pregnancy, childbirth and the puerperium, as well as of perinatal morbidity and mortality.

SECTION 6

MENTAL HEALTH STATISTICS

An effort has been made in this report to include tables showing out-patient and in-patient statistics in mental health

A number of psychiatric units are been built in various places in the country.

This means only serious cases are referred to the State Mental Hospital in Lobatse.

The psychiatric clinics cater for minor cases and some discharged patients who need routine check up when they are united with their families.

In 1979, there were 688 admissions and 937 discharges as compared to 465 admissions and 501 discharges in 1980.

The reduction in the number of in-patient in the State Mental Hospital has been mainly due to the present approach to Mental Health Care, including decentralization.

TABLE 6.1

IN-PATIENT ADMISSIONS AND DISCHARGES BY MONTH
STATE MENTAL HOSPITAL, LOBATSE 1980

MONTH	ADMISSIONS			DISCHARGES		
	MALE	FEMALE	TOTAL	MALE	FEMALE	TOTAL
January	20	20	40	35	14	49
February	22	15	37	29	10	39
March	24	12	36	30	13	43
April	25	12	37	36	11	47
May	18	10	28	26	15	41
June	12	14	26	28	18	46
July	26	16	42	19	14	33
August	23	13	36	19	15	34
September	27	19	46	26	11	37
October	25	10	35	30	12	42
November	46	19	65	18	8	26
December	22	15	37	44	20	64
TOTAL	290	175	465	340	161	501

NOTES :

- February and November male discharges include one and two escapes respectively.
- April male discharges include one death and one escape
- October male discharges includes two deaths
