## Preface

Statistics Botswana is mandated to compile data on industrial production in Botswana, hence electricity indices are only confined to electricity generated locally. However, importation and distribution volumes, and their percentage changes are included as well. This indicates Botswana's progress over time, towards generating adequate electricity to meet her demand. The data used in this brief is sourced from the Botswana Power Corporation.

This statistical brief is intended to apprise on Electricity Generation, Importation and Distribution by presenting Monthly, Quarterly and Yearly Volumes as well as Indices for Electricity Generation in Botswana. Also included are Year-on-Year and Quarter-on-Quarter Percentage Changes in Indices of Electricity Generation from 2012 to the third quarter of 2022. In subsequent sections of this report, emphasis will be on the Year-on-Year and Quarter-on-Quarter percentage changes in the physical volume of electricity generation, importation and distribution. This report uses 2013 as the base year.

The Index of Electricity Generation (IEG) stood at 187.8 during the third quarter of 2022, reflecting a year-on-year increase of 36.3 percent compared to 137.7 recorded during the corresponding quarter in 2021. The quarter-on-quarter comparison shows a decrease of 15.8 percent, from 223.0 during the second quarter of 2022.

The release further shows changes in the volume of electricity generation in a given period against the base year (2013), and hence provides a reflection of the trend in the local electricity sector.

For more information, contact the Directorate of Stakeholder Relations at 3671300. All Statistics Botswana outputs/publications are available on the website at [www.statsbots.org.bw](http://www.statsbots.org.bw) and also at the Statistics Botswana Information Resource Centre (Head-Office, Gaborone).

I sincerely thank all stakeholders involved in the formulation of this brief for their continued support, as we strive to better serve users of our products and services.

---

**Dr. Burton Mguni**  
**Statistician General**  
**December 2022**

## 1.0 Summary of Findings of the Index of Electricity Generation (IEG)

All figures in this report are not seasonally adjusted.

Key indicators of Electricity Generation from the first quarter of 2013 to the third quarter of 2022 are presented in **Table 1**.

The Index of Electricity Generation (IEG) stood at 187.8 during the third quarter of 2022, reflecting an increase of 36.3 percent compared to 137.7 recorded during the same period in 2021. The quarter-on-quarter comparison shows a decrease of 15.8 percent, from the index of 223.0 during the second quarter of 2022.

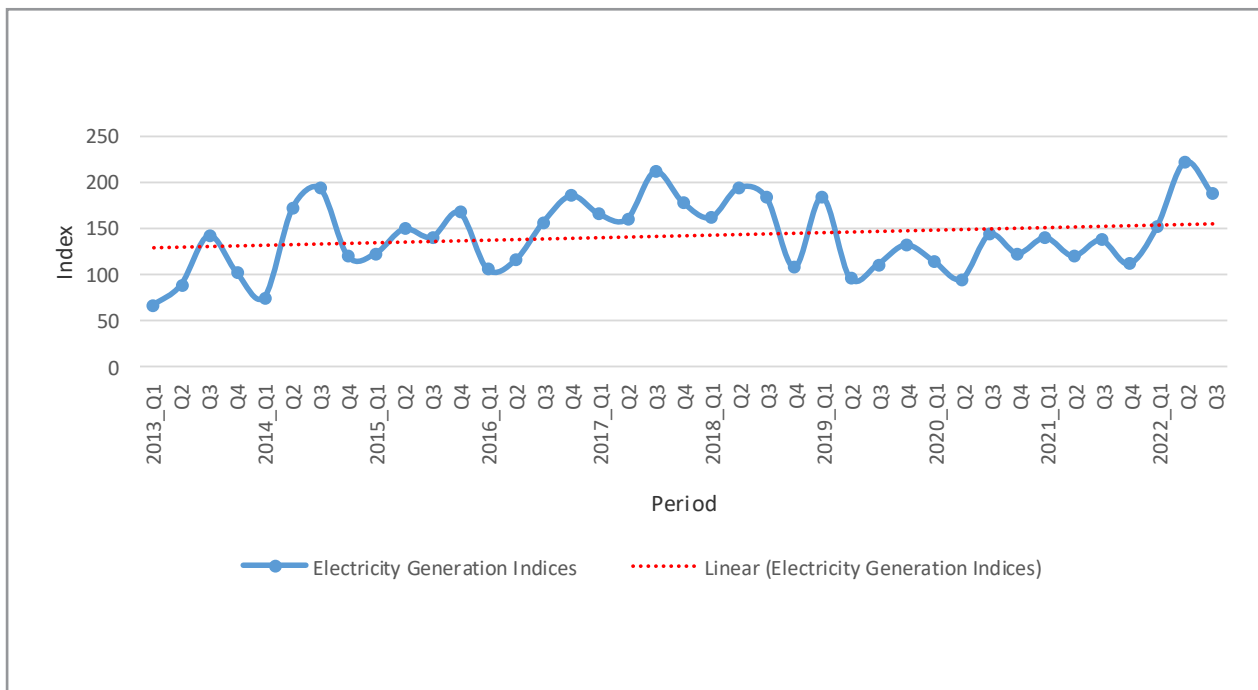

**Table 1: Selected Key Indicators of Electricity Generation: 2013 First Quarter to 2022 Third Quarter**

**Figure 1** presents the trend of the Index of Electricity Generation from the first quarter of 2013 to the third quarter of 2022. There has been some improvement in local electricity generation as evidenced by the upward trend, albeit with fluctuations between the years.

**Figure 1: Index of Electricity Generation (MWH): 2013 First Quarter to 2022 Third Quarter**

## 1.1 Electricity Generation

This Sub-Section discusses the physical volume of electricity generated locally as presented in **Table 2**. The table forms the basis for the computation of indices of electricity generation in **Table 3**. The Year-on-Year and Quarter-on-Quarter percentage changes in the physical volume of electricity generated are presented in **Table 4** and **Table 5**, covering 2012 to the third quarter of 2022.

The physical volume of electricity generated increased by 36.3 percent (210,319 MWH), from 579, 036 MWH during the third quarter of 2021 to 789,354 MWH during the current quarter.

The quarter-on-quarter perspective shows that local electricity generation decreased by 15.8 percent (148,243 MWH), from 937,597 MWH during the second quarter of 2022 to 789,354 MWH during the period under review. This decrease was mainly attributed to operational challenges realized at Morupule B power station. Morupule A and B power plants accounted for 99.1 percent of generated electricity during the quarter under review, while Matshelagabedi and Orapa emergency power plants contributed the remaining 0.5 and 0.4 percent respectively.

## 1.2 Imported Electricity

The discussions in this section are based on [tables 6, 7, 8 and 9](#) as well as [figures 2 and 3](#).

During the third quarter of 2022, the physical volume of imported electricity decreased by 32.6 percent (138,532 MWH), from 424,703 MWH during the third quarter of 2021 to 286,171 MWH during the quarter under review.

Compared to the previous quarter, imported electricity during the third quarter of 2022 shows an increase of 76.3 percent (123,831 MWH), from 162,340 MWH during the second quarter of 2022 to 286,171 MWH during the current quarter. The increase was necessitated by the need to augment the shortfall in generated electricity.

**Figure 2** shows the trend in the physical volume of imported electricity from the first quarter of 2013 to the third quarter of 2022. The downward trend indicates the country's continued effort to generate adequate electricity to meet domestic demand, hence the decreased reliance on electricity imports.

**Figure 2: Physical Volume of Imported Electricity (MWH): 2013 First Quarter to 2022 Third Quarter**

As depicted in **Figure 3**, Eskom was the main source of imported electricity at 42.0 percent of total electricity imports. The Southern African Power Pool (SAPP) accounted for 38.4 percent, while the remaining 10.1, 9.1 and 0.5 percent were sourced from Electricidade de Mozambique (EDM), Cross-border electricity markets and the Zambia Electricity Supply Corporation Limited (ZESCO), refer to [Table 9](#). Cross-border electricity markets are arrangements whereby towns and villages along the border are supplied with electricity from neighbouring countries such as Namibia and Zambia.

**Figure 3: Imported Electricity by Source: Third Quarter 2022**

### 1.3 Distribution of Electricity

The section combines local generation and imported electricity to come up with electricity that is available for distribution in Botswana. This does not take into account electricity used for auxiliary services, pumping, network losses as well as production of electricity through incineration of waste. The computation of electricity distribution is guided by the International Recommendations for Industrial Statistics (IRIS) 2008. **Tables 10, 11, 12** and **13** form the basis for discussion under this subsection.

**Table 10** shows the physical volume of electricity distributed from 2012 to the third quarter of 2022, while annual percentage changes and quarter-on-quarter percentage changes for the same period are presented in **Table 11** and **Table 12** respectively. These tables can also be used as guidance with regard to whether electricity distribution is improving over time, thereby indicating that there are ongoing efforts to meet the domestic demand.

The year-on-year perspective shows that the amount of distributed electricity increased by 7.2 percent (71,787 MWH), from 1,003,738 MWH during the third quarter of 2021 to 1,075,525 MWH during the current quarter.

The quarter-on-quarter comparison of distributed electricity shows a decrease of 2.2 percent (24,412 MWH), from 1,099,937 MWH during the second quarter of 2022 to 1,075,525 MWH during the review quarter.

As depicted in **Figure 4**, there has been a gradual increase of distributed electricity from the first quarter of 2013 to the third quarter of 2022, even though there are fluctuations.

**Figure 4: Physical Volume of Distributed Electricity (MWH): 2013 First Quarter to 2022 Third Quarter**

#### 1.3.1 Contribution of Electricity Generation to Distribution

Electricity generation given as a percentage of electricity distributed is of paramount importance in assessing whether the local generation is improving overtime to reduce reliance on imported electricity. This information is displayed in **Table 13**.

It can be observed from **Table 13** that electricity generated locally contributed 73.4 percent to electricity distributed during the third quarter of 2022, compared to a contribution of 57.7 percent during the same quarter in 2021. This gives an increase of 15.7 percentage points.

The quarter-on-quarter comparison shows that the contribution of electricity generated to electricity distributed decreased by 11.8 percentage points compared to the 85.2 percent contribution during the second quarter of 2022.

## 2.0 Technical Notes

### 2.1 Background

The generation of electricity in Botswana started in 1985 with a coal fired thermal power station at Morupule operating at a capacity of 132 MWH. Prior to this period, most of Botswana's electricity was imported from South Africa's power utility, Eskom. In 2008 South Africa's electricity demand started to exceed its supply, resulting in the South African government restricting power exports. As a result, Botswana and the entire Southern African region experienced massive power shortages because of the reduced electricity exports from South Africa ([http://en.wikipedia.org/wiki/Energy\\_in\\_Botswana](http://en.wikipedia.org/wiki/Energy_in_Botswana)).

To avert the situation, Botswana Government opted for alternative ways of sourcing electricity for the country; hence the plan to increase local generation of electricity at Morupule Power Station. The Morupule Power A plant of capacity 132 MWH was augmented with Morupule Power B which is to have a capacity of 600 MWH upon completion (BPC Annual Report, 2010).

### 2.2 Concepts and formula of the Index of Electricity Generation, Importation and Distribution

The Index of Electricity Generation is a Laspeyres index. The weighted average for electricity generation equals one because there are no various electricity products. The index is thus calculated using the formula;

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where;

I is the index

R is the electricity generation relative

W is the weight

The electricity generation relative for the quarter has been calculated by using the formula:

$$R_t = \frac{P_{ic}}{P_{i0}} * 100$$

Where  $P_{ic}$  is the electricity generation of the current quarter and  $P_{i0}$  is the generation of electricity of the base year.

The calculation of the monthly generation indices is based on the volume of electricity units produced.

### 2.3 Base Year

The base year, also referred to as **reference period** used in this brief is 2013, which is set at 100. The selection of the reference period was informed by the availability of relevant data and synchronization of data with other sectors within the industry.
