PREFACE

Statistics Botswana compiles data on industrial production in Botswana, hence electricity indices in this report are only confined to electricity generated locally. However, importation and distribution volumes, and their percentage changes are included as well. This indicates Botswana's progress over time, towards generating adequate electricity to meet her demand. The data used in this brief is sourced from the Botswana Power Corporation.

This statistical brief is intended to apprise on Electricity Generation, Importation and Distribution by presenting Monthly, Quarterly and Yearly Volumes as well as Indices for Electricity Generation in Botswana. Also included are Year-on-Year and Quarter-on-Quarter percentage changes in Indices of Electricity Generation from 2013 to the first quarter of 2024. In subsequent sections of this report, emphasis is on the Year-on-Year and Quarter-on-Quarter percentage changes in the physical volume of electricity generation, importation and distribution. The base year for the indices is 2013.

The Index of Electricity Generation (IEG) stood at 190.2 during the second quarter of 2024 compared to 157.1 recorded during the corresponding quarter in 2023, reflecting a year-on-year increase of 21.1 percent. The quarter-on-quarter comparison showed a similar trend with an increase of 1.0 percent, from 188.2 during the first quarter of 2024 to 190.2 during the current quarter.

For more information, contact the Directorate of Stakeholder Relations at 3671300. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and also at Statistics Botswana Information Resource Centre (Head-Office, Gaborone).

I sincerely thank all stakeholders involved in the formulation of this brief for their continued support, as we strive to better serve users of our products and services.

Dr. Lucky Mōkgatlhe
Acting Statistician General
September 2024

1.0 Summary of Findings of the Index of Electricity Generation (IEG)

All figures in this report are not seasonally adjusted.

The Index of Electricity Generation (IEG) stood a **190.2** during the second quarter of 2024 compared to **157.1** recorded during the same period in 2023, to an increase of 21.1 percent. However, the quarter-on-quarter comparison shows an increase of **1.0** percent, from the index of **188.2** during the first quarter of 2024. Key indicators of Electricity Generation from the first quarter of 2013 to the second quarter of 2024 are presented in **Table 1**.

Table 1: Selected Key Indicators of Electricity Generation: 2013 First Quarter to 2024 Second Quarter

Note: 1. () Indicates negative figures

Figure 1 presents the trend of the Index of Electricity Generation from the first quarter of 2013 to the second quarter of 2024. Although the index fluctuates, it should, however be noted that there has been an improvement in local electricity generation as evidenced by the upward trend.

Figure 1: Index of Electricity Generation (MWH): 2013 First Quarter to 2024 Second Quarter

1.1 Electricity Generation

This Sub-Section discusses the physical volume of electricity generated locally as presented in Table 2. The table forms the basis for the computation of indices of electricity generation in Table 3. The Year-on-Year and Quarter-on-Quarter percentage changes in the physical volume of electricity generated are presented in Table 4 and Table 5, covering 2013 to the second quarter of 2024.

The physical volume of generated electricity increased by 21.1 percent (139,174 MWH), from 660,349 MWH during the second quarter of 2023 to 799,523 MWH during the current quarter.

The quarter-on-quarter perspective shows that local electricity generation increased by 1.0 percent (8,256 MWH), from 791,267 MWH during the first quarter of 2024 to 799,523 MWH during the period under review. This increase was mainly attributed to the improvement of the Morupule A and B power stations.

During the quarter under review, the Morupule A and B power stations were responsible for a significant 97.9 percent of the total electricity generated, showcasing their vital role in meeting the country's energy needs. Additionally, the Orapa emergency power plant made a modest contribution of 1.8 percent to the national grid. Furthermore, the integration of electricity generated from solar power stations into the national grid during the second quarter of 2024 indicated a rising focus on renewable energy sources, accounting for 0.3 percent of the local electricity generation mix. The connection of the Bobonong, Phakalane, and Shakawe Solar Power plants to the national grid signifies a growing dedication to broadening the sources of electricity production.

1.2 Imported Electricity

The discussions in this section are based on **Table 6, 7, 8 and 9** as well as **Figures 2 and 3**.

During the second quarter of 2024, the physical volume of imported electricity decreased by 17.8 percent (82,839 MWH), from 464,603 MWH during the second quarter of 2023 to 381,764 MWH.

The amount of imported electricity decreased by 6.9 percent (28,255 MWH) during the second quarter of 2024 compared to the previous quarter, from 410,020 MWH to 381,764 MWH.

Figure 2 shows the trend in the physical volume of imported electricity from the first quarter of 2013 to the second quarter of 2024. The gradual decrease indicates that the country's continued effort to generate adequate electricity to meet domestic demand, has on average led to a declining reliance on electricity imports.

Figure 2: Physical Volume of Imported Electricity (MWH): 2013 First Quarter to 2024 Second Quarter

As depicted in **Figure 3**, the Zambia Electricity Supply Corporation Limited (ZESCO) was the main source of imported electricity at 40.5 percent of total electricity imported. Eskom accounted for 38.5 percent, while the remaining 7.1, 6.4, 4.9 and 2.6 percent were sourced from the Electricidade de Mozambique (EDM), Namibia Power Corporation (Nampower), Cross-border electricity markets and the Southern African Power Pool (SAPP) respectively (**Table 9**). Cross-border electricity markets is an arrangement where towns and villages along the border are supplied with electricity from neighbouring countries such as Namibia and Zambia.

Figure 3: Imported Electricity by Source: Second Quarter 2024

1.3 Distribution of Electricity

The section combines the local generation and imported electricity to come up with electricity that is available for distribution in Botswana. This does not take into account electricity used for auxiliary services, pumping, network losses as well as the production of electricity through incineration of waste. The computation of electricity distribution is guided by the International Recommendations for Industrial Statistics (IRIS) 2008. Tables 10, 11, 12 and 13 form the basis for discussion under this subsection.

Table 10 shows the physical volume of electricity distributed from 2013 to the second quarter of 2024, while annual percentage changes and quarter-on-quarter percentage changes for the same period are presented in Table 11 and 12 respectively. These tables can also be used as guidance as to whether electricity distributed is improving over time.

The year-on-year comparison shows that distributed electricity increased by 5.0 percent (56,336 MWH), from 1,124,952 MWH in the second quarter of 2023 to 1,181,287 MWH during the current quarter.

The quarter-on-quarter comparison of distributed electricity shows a decrease of 1.7 percent (20,000 MWH), from 1,201,287 MWH during the first quarter of 2024 to 1,181,287 MWH during the quarter under review.

As depicted in Figure 4, there has been a gradual increase of distributed electricity from the first quarter of 2013 to the second quarter of 2024, in spite of the fluctuations.

Figure 4: Physical Volume of Distributed Electricity (MWH): 2013 First Quarter to 2024 Second Quarter

1.3.1 Contribution of Electricity Generation to Distribution

Electricity generation given as a percentage of electricity distributed is of paramount importance in assessing whether the local generation is improving overtime to reduce reliance on imported electricity. This information is displayed in Table 13.

It can be observed from Table 13 that electricity generated locally contributed 67.7 percent to electricity distributed during the second quarter of 2024, compared to a contribution of 58.7 percent during the same quarter in 2023. This gives an increase of 9.0 percentage points.

The quarter-on-quarter comparison shows that the contribution of electricity generated to electricity distributed increased by 1.8 percentage points, from 65.9 percent during the first quarter of 2024 to 67.7 percent.

2.0 Technical Notes

2.1 Background

The generation of electricity in Botswana started in 1985 with a coal fired thermal power station at Morupule operating at a capacity of 132 MWH. Prior to this period, most of Botswana's electricity was imported from South Africa's power utility, Eskom. In 2008 South Africa's electricity demand started to exceed its supply, resulting in the South African government restricting power exports. As a result, Botswana and the entire Southern African region experienced massive power shortages because of the reduced electricity imports from South Africa (http://en.wikipedia.org/wiki/Energy_in_Botswana).

To avert the situation, Botswana Government opted for alternative ways of sourcing electricity for the country; hence the plan to increase local generation of electricity at Morupule Power Station. The Morupule Power A plant of capacity 132 MWH was augmented with the construction of Morupule Power B plant having production capacity of 600 MWH (BPC Annual Report, 2010).

2.2 Concepts and formula of the Index of Electricity Generation, Importation and Distribution

The Index of Electricity Generation is a Laspeyres index. The weighted average for electricity generation equals one because there are no various electricity products. The index is thus calculated using the formula;

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where;

I is the index

R is the electricity generation relative

W is the weight

The electricity generation relative for the quarter has been calculated by using the formula:

$$R_i = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_c is the electricity generation of the current quarter and P_o is the generation of electricity of the base year.

The calculation of the monthly generation indices is based on the volume of electricity units produced.

2.3 Base Year

The base year, also referred to as **reference period** used in this brief is 2013, which is set at 100. The selection of the reference period was informed by the availability of relevant data and synchronization of data with other sectors within the industry.
