1.0 Preface

Statistics Botswana is mandated to compile data on industrial production in Botswana, hence the Index of Mining Production is confined to minerals extracted across the country. This is intended to monitor the performance of the mining sector in Botswana.

This statistical release presents quarterly Indices of Mining Production (IMP) for the period 2013 to the second quarter of 2023. Also included in the report are the annual IMP for the period 2013 to 2022, derived as the average of the four quarters of the year. The base year is 2013. Data used in this publication are sourced from the Department of Mines under the Ministry of Minerals and Energy.

The Index of Mining Production stood at 99.6 in the second quarter of 2023, showing a year-on-year increase of 9.9 percent from 90.6 recorded in the second quarter of 2022. Comparison on a quarter-on-quarter basis shows a decrease of 12.8 percent, from the index of 114.3 realised during the first quarter of 2023.

The release further shows the contribution of each mineral and mineral group to the Year-on-Year Percentage Change in the Volume of Mining Production, and provides the trend in the local mining sector.

For more information, contact the Directorate of Stakeholder Relations on (+267) 3671300. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Dr Burton S. Mguni
Statistician General
September 2023

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for the Index of Mining Production (**IMP**) from the first quarter of 2013 to the second quarter of 2023. This table forms the basis for the discussions under Sub-Section 2.1. Reference, however, is made to this table and other tables throughout the report.

2.1 Index of Mining Production

The Index of Mining Production stood at **99.6** during the second quarter of 2023, showing a year-on-year growth of **9.9** percent, from **90.6** registered in the second quarter of 2022. The main contributors to the increase in mining production were Diamond and Copper in Concentrates with 5.4 and 4.6 percentage points respectively, as shown in **Table 2**. Coal, Gold and Soda Ash contributed negatively but minimally to the index of mining production.

The quarter-on-quarter analysis shows a decrease of **12.8** percent from the index of 114.3 registered in the first quarter of 2023 to **99.6** observed during the period under review.

Table 1: Key Figures in the Volume of Mining Production

Base Period : 2013=100

Figure 1: Total Index of Mining Production for the First Quarter of 2013 to the Second Quarter of 2023

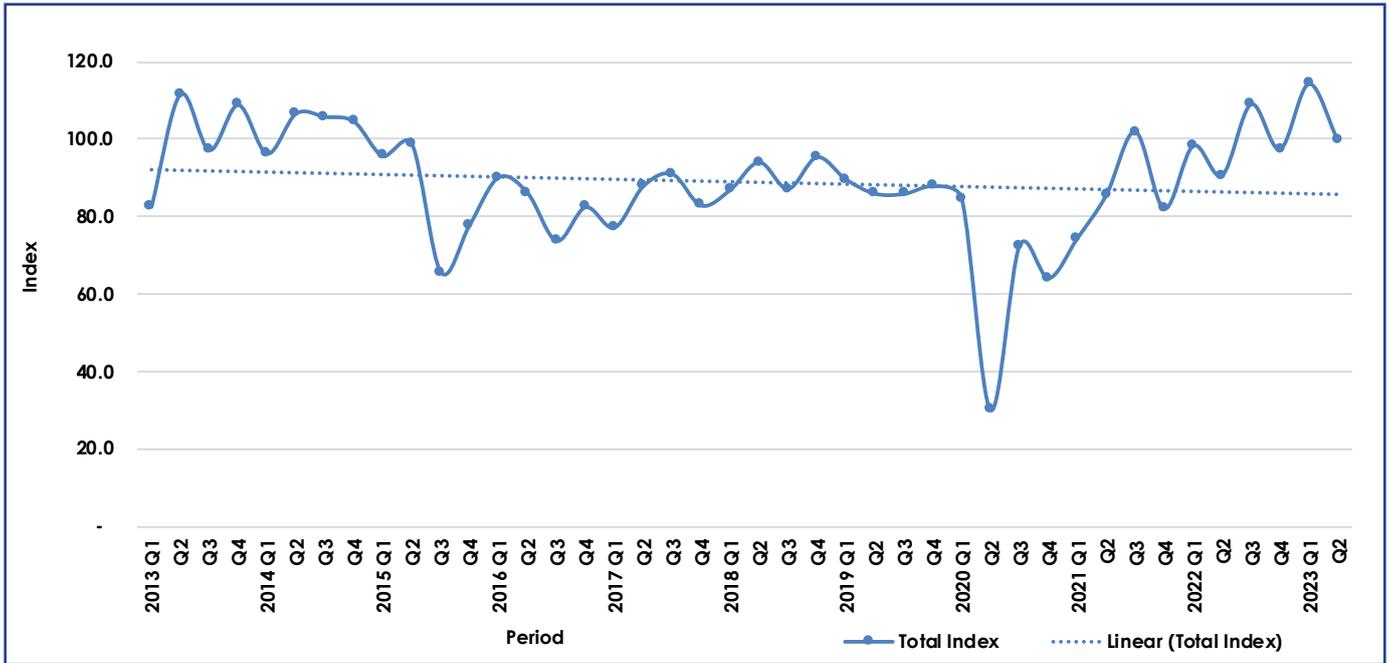

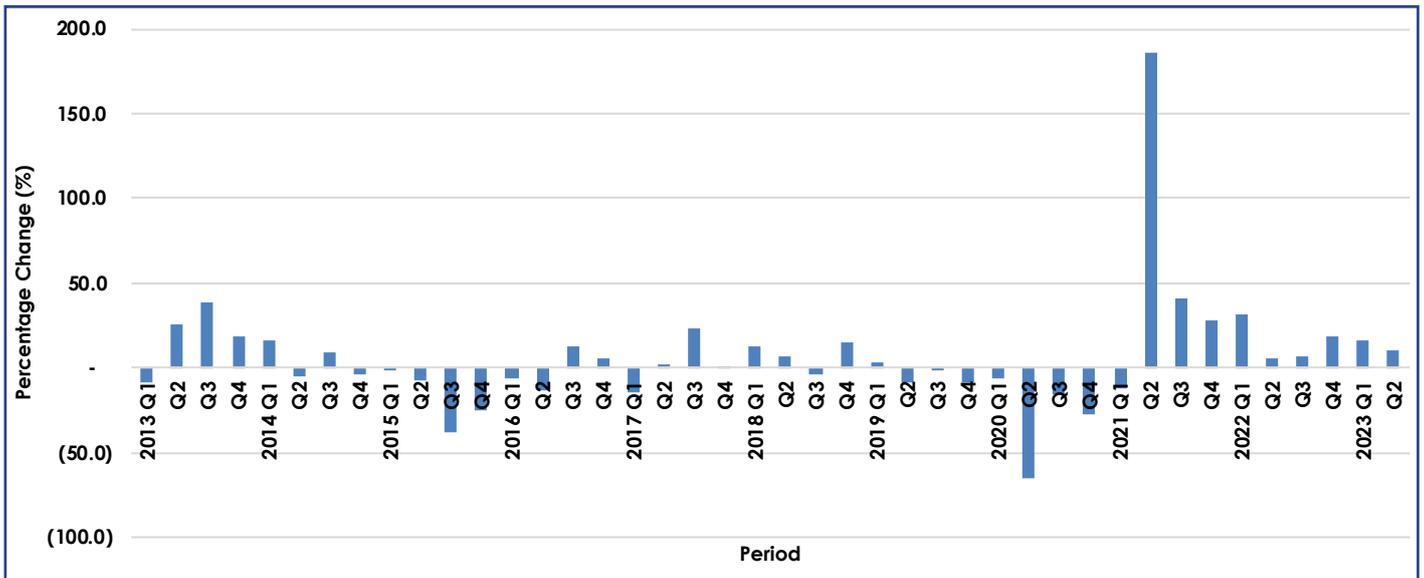

Figure 1 shows the graphical presentation of the Total Index of Mining Production from the first quarter of 2013 to the second quarter of 2023. The linear graph shows that, on average, mining production has been declining gradually, between the years 2013 and 2023.

Figure 2: Year-on-Year Percentage Change in Mining Production- First Quarter of 2013 to Second Quarter of 2023

2.2 Mineral Production

The discussion on mineral production that compares production during the second quarter of 2023 to the same quarter of 2022, are based on Table 2, Table 3 and Table 6. Table 5 provides an analysis of the mineral production for the quarter under review, in comparison to the preceding quarter.

Diamond production increased by 6.2 percent (346 thousand carats) from 5,576 thousand carats during the second quarter of 2022 to 5,922 thousand carats during the period under review. On the other hand, quarter-on-quarter analysis shows that production decreased by 15.3 percent (1,067 thousand carats) during the second quarter of 2023 compared to 6,989 thousand carats recorded during the first quarter of 2023.

Copper in Concentrates increased by 50.9 percent (5,408 tonnes) from 10,619 tonnes registered during the second quarter of 2022 to 16,027 tonnes during the period under review. The quarter-on-quarter analysis also shows that production increased by 7.8 percent (1,155 tonnes) during the second quarter of 2023 compared to 14,872 tonnes produced during the first quarter of 2023.

Gold production decreased by 29.9 percent (45 kilograms), from 150 kilograms extracted during the second quarter of 2022 to 105 kilograms during the second quarter of 2023. On the other hand, the quarter-on-quarter analysis reflects an increase of 51.2 percent (36 kilograms) from 70 kilograms during the first quarter of 2023 to 105 kilograms registered during the quarter under review.

Soda Ash production decreased by 26.2 percent (16,145 tonnes) from 61,647 tonnes during the second quarter of 2022 to 45,502 tonnes produced during the period under review. Similarly, quarter-on-quarter analysis shows that production decreased by 22.9 percent (13,538 tonnes) during the second quarter of 2023, from 59,040 tonnes registered during the first quarter of 2023.

Salt production increased by 32.6 percent (17,657 tonnes), from 54,124 tonnes during the second quarter of 2022 to 71,781 tonnes during the quarter under review. On the other hand, quarter-on-quarter analysis shows that salt production decreased by 22.1 percent (20,326 tonnes) from 92,107 tonnes registered in the first quarter of 2023.

Silver production increased by 55.4 percent (4,178 kilograms) from 7,542 kilograms in the second quarter of 2022 to 11,720 kilograms in the period under review. The quarter-on-quarter analysis shows that production decreased by 6.9 percent (862 kilograms) during the second quarter of 2023 from 12,582 kilograms produced during the first quarter of 2023.

Coal production decreased by 21.5 percent (128,596 tonnes), from 599,474 tonnes during the second quarter of 2022, to 470,878 tonnes in the current quarter. Similarly, quarter-on-quarter comparison shows that coal production decreased by 27.0 percent (173,796 tonnes) compared to 644,674 tonnes during the first quarter of 2023.

Copper-Nickel-Cobalt Matte, recorded zero production during the period under review. The affected mines are still undergoing provisional liquidation

Table 2: Index of Mining Production for the Second Quarter of 2023 by Mineral Groups and Minerals

Base:2013=100						
Mineral	Weights (2013)	Apr-Jun 2022	Apr-Jun 2023	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production	
Diamonds	82.5	96.4	102.4	6.2	5.4	
Copper-Nickel-Cobalt Matte	8.6	n.a.	n.a.	n.a.	n.a.	
Copper in Concentrates	5.5	150.9	227.8	50.9	4.6	
Gold	1.4	49.9	35.0	(29.9)	(0.2)	
Soda Ash	0.9	108.2	79.9	(26.2)	(0.3)	
Salt	0.5	41.5	55.1	32.6	0.1	
Silver	0.4	133.5	207.5	55.4	0.4	
Coal	0.3	160.3	125.9	(21.5)	(0.1)	
Total	100	90.6	99.6	9.9	9.9	

Note: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.

- () denotes negative numbers
- n.a. signifies data not available/no production during the specified period.

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs, which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real Gross Domestic Product (GDP), contributing between 20 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time. Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP, according to the quarterly GDP reports produced by Statistics Botswana. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of the change in the production of minerals in Botswana cannot be over emphasised. The index of the physical volume of mining production is such a measure that provides a relative change over time in mining production. The IMP can also be used as a deflator to calculate the GDP at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Silver, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and the Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons, but for comparisons between countries.

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production, which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period used in this brief, is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular period.

The data produced are not seasonally adjusted. However, there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-Year Percentage Change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Quarter-on-Quarter percentage change

Quarter-on-Quarter percentage change in a variable for any given period is the rate of change expressed over the previous quarter.

4.7 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.8 Rounding-off of figures

The figures in the tables have, where necessary, been rounded off to the nearest number shown. There may be slight discrepancies between the sums of the constituent items and the totals shown.

4.9 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i \cdot W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the i^{th} item for the quarter has been calculated by using the formula:

$$R_i = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_{ic} is the production of the i^{th} item in the current quarter and P_{i0} is the production of the i^{th} item in the base year.
