1.0 Preface

This statistical release presents quarterly Indices of Mining Production **(IMP)** for the period 2003 to the first quarter of 2016. Also carried in the report is the annual IMP for the period 2003 to 2015, derived as the average of the four quarters of the year. This report uses 2013 as a base year. Data used in this publication is sourced from the Department of Mines; Ministry of Minerals, Energy and Water Resources.

For more information, contact the Directorate of Stakeholder Relations on 3671300. All Statistics Botswana outputs/publications are available on the website at www.cso.gov.bw and at the Statistics Botswana Library (Head-Office, Gaborone).

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of our products and services.

Ms. Anna N. Majelantle
Statistician General
July 2016

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for Indices of Mining Production **(IMP)** from 2013 to the first quarter of 2016. This table forms the basis of the discussion under Sub-Section 2.1. Reference will however, be made to this table and other tables throughout the report.

Table 1: Key Figures in the Volume of Mining Production

	Base Period : 2013=100		
Period	Index of the physical volume of mining production	Year-on-year percentage change	Quarter-on-Quarter percentage change
Q1_2013	82.5	(8.7)	(9.7)
Q2_2013	111.6	25.2	35.3
Q3_2013	97.1	38.4	(12.9)
Q4_2013	108.8	19.1	12.0
Q1_2014	96.2	16.7	(11.5)
Q2_2014	106.6	(4.5)	10.8
Q3_2014	105.7	8.9	(0.8)
Q4_2014	104.5	(4.0)	(1.2)
Q1_2015	95.6	(0.7)	(8.6)
Q2_2015	98.7	(7.4)	3.3
Q3_2015	65.6	(37.9)	(33.5)
Q4_2015	77.9	(25.5)	18.7
Q1_2016	90.2	(5.6)	15.8

Note: () denotes negative numbers

2.1 Indices of Mining Production

The Index of Mining Production stood at 90.2 in the first quarter of 2016 showing a negative year-on-year decline of 5.6 percent from 95.6 during the 2015 first quarter.

The main contributor to the decline in growth of mining production was Diamond production, which contributed negative 4.6 percentage points (**Tables 2** and **6**). Although less in weight, Copper in Concentrates also contributed to the overall Index of Mining Production decline with negative 4.3 percent.

Copper-Nickel-Cobalt Matte, Soda Ash and Gold contributed positively to the overall mining production, with contributions of 2.8 percentage points, 0.5 and 0.1 of a percentage point respectively during the first quarter of 2016. Notwithstanding their positive contribution to the overall index, the three minerals' combined weight is insignificant to influence the overall year-on-year percentage change in the total mining production to positive growth (see **Table 5** and **Table 6**).

As compared to the fourth quarter of 2016, the Index of Mining Production shows an increase of 15.8 percent from 77.9 during 2015 fourth quarter to 90.2 during 2016 first quarter. It can be seen from **Table 1** that this quarterly increase was following another quarterly increase of 18.7 percent from 65.6 during the third quarter of 2015 to 77.9 during the fourth quarter of the same year. These quarterly increases are mainly attributed to production of Diamonds and Copper-Nickel -Cobalt Matte.

2.2 Mineral Production

Discussions on mineral production, comparing production during the first quarter of 2016 to the same quarter of 2015 as well as production during the preceding quarter, are based on Table 4 and Table 5. Table 4 shows quarter-on-quarter percentage changes while year-on-year percentage changes are displayed on Table 5.

Diamond production shows the sixth consecutive year-on-year decrease, having declined by 5.3 percent in the first quarter of 2016 as compared to the first quarter of 2015 (Table 5). However, when looking at the quarter-on-quarter changes (Table 4), diamond production during 2016 first quarter increased by 11.7 percent as compared to production during 2015 fourth quarter. This follows an increase of 15.5 percent in production from the third quarter of 2015 to the fourth quarter of the same year. The increase in the recent quarter-on-quarter productions can be indicative of improvement in trading conditions leading to the need to increase production to supply the demand.

Copper-Nickel-Cobalt Matte production increased by 35.8 percent in the first Quarter of 2016 when compared to production during the first quarter of the previous year (Table 5). Comparison of production during the first quarter of 2016 and the fourth quarter of 2015 shows an increase of 78.7 percent (Table 4). This follows an increase of more than two fold from the third quarter of 2015 to the fourth quarter of the same year.

Gold production increased by 16.0 percent in the first Quarter of 2016 as compared to the same quarter of 2015. This increase was as a result of higher than expected gold recoveries from the ore. However, comparison of production during the current quarter and the last quarter of 2015 gives a decrease of 14.7 percent.

Soda Ash production increased by 67.3 percent in the first quarter of 2016 when compared to production during 2015 first quarter. Production during 2016 first quarter gives decrease of 6.4 percent when compared to production during 2015 fourth quarter.

Salt production increased by 14.8 percent during the first quarter of 2016 when compared to production during 2015 first quarter. However, comparison of production during the first quarter of 2016 and the last quarter of 2015 shows a decline of 12.7 percent.

Coal production decreased by 9.8 percent in the first quarter of 2016 as compared to the corresponding quarter of 2015. Comparison of the first quarter of 2016 and 2015 quarter four gives a decline of 15.6 percent. The decrease was largely attributable to weak domestic demand owing to operational challenges experienced during the first quarter of 2016 at the Morupule B power plant.

Silver and Copper in Concentrates recorded zero production during the period under review and for the preceding quarter. This is as a result of the provisional liquidation of the concerned companies which necessitated halting of production at the respective mines.

Table 2: Index of Mining Production for the latest Quarter by Mineral Groups and Minerals

Mineral	Weights (2013)	Jan-Mar, 2015	Jan-Mar, 2016	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production
			Base:2013=100		
Diamonds	82.5	99.1	93.9	(5.3)	(4.6)
Copper-Nickel-Cobalt Matte	8.6	87.6	119.0	35.8	2.8
Copper in Concentrates	5.5	74.3	n.a	(100.0)	(4.3)
Gold	1.4	51.7	60.0	16.0	0.1
Soda Ash	0.9	73.4	122.9	67.3	0.5
Salt	0.5	61.6	70.7	14.8	0.0
Silver	0.4	49.6	n.a	(100.0)	(0.2)
Coal	0.3	126.9	114.4	(9.8)	(0.0)
Total	**100**	**95.6**	**90.2**	**(5.6)**	**(5.6)**

NB: The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.
() denotes negative numbers

Table 3: Index of the Volume of Mining Production by Mineral Group and Mineral

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi- Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real gross domestic product (GDP), contributing between 30 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of change in the production of minerals in Botswana cannot be over emphasized. The index of physical volume of mining production is such a measure that provides a relative change over time in mining production. IMP can also be used as a deflator to calculate the gross domestic product (GDP) at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals occurring naturally as solids such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons but for comparisons between countries
The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period, also referred to as reference period used in this brief is 2013 and it is set at 100.

4.3   Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4   Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular month.

The data produced is not seasonally adjusted. However there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5   Year-on-year percentage change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6   Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then diving by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.7   Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the ith item for the quarter has been calculated by using the formula:

$$(R_i) = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_{ic} is the production of the ith item in the current quarter and P_{i0} is the production of the ith item in the base year.
