1.0 Preface

This statistical release presents quarterly Indices of Mining Production (IMP) for the period first quarter of 2012 to the first quarter of 2019. Also carried in the report are the annual IMP for the period 2012 to 2018, derived as the average of the four quarters of the year. This report uses 2013 as a reference year. Data used in this publication are sourced from the Department of Mines under the Ministry of Mineral Resources, Green Technology and Energy Security.

The Index of Mining Production stood at 89.6 during the first quarter of 2019, showing a year-on-year increase of 3.1 percent from 86.9 during the first quarter of 2018. Comparison on a quarter-on-quarter basis shows a decrease of 6.0 percent, from the index of 95.3 realised during the fourth quarter of 2018 to 89.6 registered during the first quarter of 2019.

The release further shows the contribution of each mineral and mineral group to the Year-on-Year Percentage Change in the Volume of Mining Production, and hence provides a reflection of the trend in the local mining sector.

Statistics Botswana is mandated to compile data on industrial production in Botswana, hence index of mining production is only confined to minerals extracted across the country. This is intended to monitor the performance of the mining sector in Botswana.

For more information, contact the Directorate of Stakeholder Relations on (+267) 3671300. All Statistics Botswana outputs/publications are available on the website at <u>www.statsbots.org.bw</u> and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Dr Burton S. Mguni Statistician General June 2019

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for the Index of Mining Production (IMP) from the first quarter of 2013 to the first quarter of 2019. This table forms the basis for the discussions under Sub-Section 2.1. Reference, however, will be made to this table and other tables throughout the report.

2.1 Index of Mining Production

The Index of Mining Production stood at 89.6 during the first quarter of 2019, showing a year-on-year increase of 3.1 percent from 86.9 during the first quarter of 2018. The main contributor to the increase in the index was Diamonds, having contributed 3.2 percentage points as shown in **Table 2**.

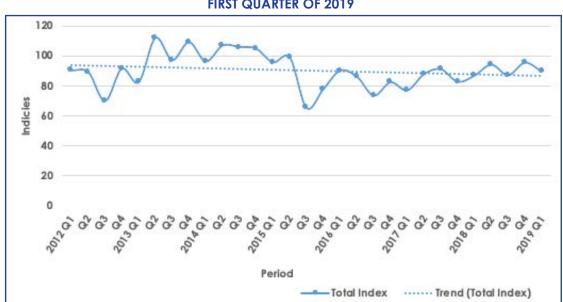

The quarter-on-quarter analysis shows a decrease of 6.0 percent, from the index of 95.3 during the fourth quarter of 2018 to 89.6 observed during the reference period.

	Base Period : 2013=100								
Period	Index of the physical volume of mining production	Year-on-Year percentage change	Quarter-on-Quarter percentage change						
Q1_2013	82.5	(8.7)	(9.7)

Q4_2017	82.8	0.5	(9.0)						
Q1_2018	86.9	12.6	4.9						
Q2_2018	94.0	7.0	8.3						
Q3_2018	87.1	(4.2)	(7.4)						
Q4_2018	95.3	15.1	9.4						
Q1_2019	89.6	3.1	(6.0)						

Table 1: Key Figures in the Volume of Mining Production

Note: 1. () denotes negative numbers

Figure 1 shows the graphical presentation of the Total Index from the first quarter of 2012 to the first quarter of 2019. The graph shows that despite the fluctuations realised over the period, on average, it can be observed that production has been on a slight but gradual decline between 2012 and 2019.

2.2 Mineral Production

Discussions on mineral production, which compare production during the first quarter of 2019 to the same quarter of 2018, are based on **Table 2** and **Table 5**. Table 4 provides quarter-on-quarter analysis of the mineral production, for the quarter under review, giving comparison to the preceding quarter.

Diamond production decelerated during the period under review, increasing by 3.3 percent during the first quarter of 2019, as compared to an increase of 11.5 percent registered in the same quarter of the previous year. Although diamond production increased, it is important to note that one of the plants was closed during the first quarter of 2019 to allow for care and maintenance. The quarter-on-quarter analysis reflects that diamond production decreased by 5.4 percent during the first quarter of 2019 compared to the last quarter of the previous year.

Gold production decreased by 16.9 percent during the first quarter of 2019 compared to the same quarter of 2018. The increase was as a result of unstable commodity prices as well as the notable deteriorating lifespan of the mine. The quarter-on-quarter analysis also shows a decrease of 31.3 percent during the first quarter of 2019 compared to the fourth quarter of 2018.

The year-on-year comparison shows that Soda Ash production recorded positive growth for the fifth consecutive quarter, increasing by 14.6 percent during the first quarter of 2019, compared to the same quarter of the previous year. The continued improvement in production may be attributable to the plant's high efficiency following the plant refurbishment which occurred in 2017. On the other hand, the quarter-on-quarter analysis shows that production declined by 13.4 percent during the period under review.

Salt production recorded an increase of 29.6 percent during the first quarter of 2019 compared to the same quarter of 2018. The quarter-on-quarter comparison on the other hand, shows a decrease of 21.9 percent during the first quarter of 2019 compared to the preceding quarter.

Coal production dropped for the second consecutive quarter, declining by 7.1 percent during the first quarter of 2019 compared to the same quarter of the previous year. Although production fell, it is important to note that there was no shortfall in supply of coal due to stockpiling.

The quarter-on-quarter comparison on the other hand shows that coal production rose slightly by 0.3 percent when compared to the preceding quarter.

Copper-Nickel-Cobalt Matte, Copper in Concentrates and Silver recorded zero production during the period under review. The instability and uncertainty of commodity prices affected the operations of the involved mines, which made it difficult to sustain themselves at the current prices, leading to the provisional liquidation.

Table 2: Index of Mining Production for the latest Quarter by Mineral Groups and Minerals

	Base:2013=100									
Mineral	Weights (2013)	Jan-Mar 2018	Jan-Mar 2019	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production					
Diamonds	82.5	101.8	105.1	3.3	3.2					
Copper-Nickel-Cobalt Matte	8.6	n.a.	n.a.	n.a.	0.0					
Copper in Concentrates	5.5	1.9	n.a.	(100.0)	(0.1)					
Gold	1.4	78.9	65.6	(16.9)	(0.2)					
Soda Ash	0.9	113.2	129.8	14.6	0.2					
Salt	0.5	66.0	85.5	29.6	0.1					
Silver	0.4	n.a.	n.a.	n.a.	0.0					
Coal	0.3	159.7	148.3	(7.1)	(0.0)					
Total	100	86.9	89.6	3.1	3.1					

NB: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.

2. () denotes negative numbers

3. "n.a." signifies data not available/no production during the specified period.

Table 6: Contribution of Each Mineral Group and Mineral to the Year-on-Year Percentage Change in the Volume of Mining Production

Note: 1. () Denote negative numbers.

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs, which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selebi Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real Gross Domestic Product (GDP), contributing between 20 and 50 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time. Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP, according to the quarterly GDP reports produced by Statistics Botswana. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and the national economy, the need for a measure of the change in the production of minerals in Botswana cannot be over emphasised. The index of the physical volume of mining production is such a measure that provides a relative change over time in mining production. The IMP can also be used as a deflator to calculate the GDP at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans the data, produces statistical tables and produces reports which are then packaged and disseminated to users. The results of the survey are used to calculate the volume of mining production indices on a quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Silver, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and the Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude. The index form is used not only for intertemporal comparisons, but for comparisons between countries.

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production, which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared and whose values provide the weights for an index. The base period used in this brief, is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular period.

The data produced are not seasonally adjusted. However, there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-Year Percentage Change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Quarter-on-Quarter percentage change

Quarter-on-Quarter percentage change in a variable for any given period is the rate of change expressed over the previous quarter.

4.7 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.8 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i^* W_i}{\sum W_i}$$

Where; I is the index, **R**, is the production relative of item **i** and **W**, is the weight allocated to item **i**

The production relative (R) of the *i*th item for the quarter has been calculated by using the formula:

$$\boldsymbol{R}_i = \frac{\boldsymbol{P}_{ic}}{\boldsymbol{P}_{io}} *100$$

Where P_{ic} is the production of the *i*th item in the current quarter and P_{io} is the production of the *i*th item in the base year.
